– I prefer to take the names of important scientific quantities from ancient languages, so they may be the same in all living languages. I therefore propose to call **entropy** the quantity (S) of a body from the Greek word for transformation: $\eta \tau \rho \sigma \pi \eta$

Rudolf Clausius

– Quantities of the form $H = -\sum p_i \text{Log } p_i$ play a central role in information theory as measures of information, choice and uncertainty. The form of H will be recognized as that of **entropy** as defined in certain formulations of statistical mechanics where p_i is the probability of a system being in cell i of its phase space. H is then, for example, the H in Boltzmann’s famous H theorem. We shall call $H = -\sum p_i \text{Log } p_i$ the **entropy** of the set of probabilities p_1, \dots, p_n .

Claude Shannon

– The fact that you can remember yesterday but not tomorrow is because of **entropy**. The fact that you’re always born young and then you grow older, and not the other way around like Benjamin Button - it’s all because of **entropy**. So I think that **entropy** is underappreciated as something that has a crucial role in how we go through life.

Sean M.Carroll

Preface

The concept of entropy has its origins in classical physics under the second law of thermodynamics, a law considered to underpin our fundamental understanding of time in physics. Attempting to analyse the analog world around us requires that we measure time in discrete steps, but doing so compromises our ability to measure entropy accurately. Since the introduction of approximate entropy by Pincus three decades ago¹, the use of information theoretic entropy measures to estimate the complexity, randomness or regularity of time series data has become ubiquitous in many research domains (Fig. 1a). Applications of entropy are ever-increasing (Fig. 1b), as are the number of new entropies that aim to estimate entropy with greater accuracy, less sensitivity to data length, amplitude fluctuations, etc. (see Ribiero et al.²)

Although many functions for estimating these entropies can be found in various corners of the internet, there is currently no toolkit to perform entropic time-series analysis at the

command line with reliable code, extensive documentation and consistent syntax, that is also accessible in multiple programming languages. Hence, the goal of EntropyHub is to integrate the many established entropy methods into one package that is available for users of Python, MatLab and Julia.

EntropyHub features multiscale variants of all base and cross-entropy methods, (including composite, refined and hierarchical multiscale approaches), in addition to bidimensional entropies for 2D matrix analysis. As the scientific community develops novel entropic measures, efforts will be made to incorporate them in later versions of the package.

EntropyHub is licensed under the Apache License (Version 2.0) and is free to use by all on condition that the following reference be included on any outputs realized using the software:

Matthew W. Flood and Bernd Grimm,
EntropyHub: An Open-Source Toolkit for Entropic Time Series Analysis,
2021 github.com/MattWillFlood/EntropyHub

If you find this package useful, please consider starring it on GitHub, MatLab File Exchange, PyPI or Julia Packages. This helps us to gauge user satisfaction.

Thank you for using EntropyHub,

Matt

Introduction

It is important to clarify at the outset that the term *entropy* henceforth described refers to entropy in the context of probability theory and information theory as defined by Shannon¹, and not thermodynamic or other entropies from classical physics.

EntropyHub functions fall into five categories:

Base	functions for estimating the entropy of a single univariate time series.
Cross	functions for estimating the entropy between two univariate time series.
Bidimensional	functions for estimating the entropy of a two-dimensional univariate matrix.
Multiscale	functions for estimating the multiscale entropy of a single univariate time series using any of the Base entropy functions.
Multiscale Cross-	functions for estimating the multiscale entropy between two univariate time series using any of the Cross-entropy functions.

[See *Table 1.1* for a list of all functions]

¹Claude E. Shannon,
A Mathematical Theory of Communication
Bell System Technical Journal (1948), 27 (3): 379–423.

While each function has its own unique keyword arguments, there are several keyword arguments (also known as Name/Value pairs in MatLab) common to most `Base`, `Cross` and `Bidimensional` entropies. These are:

m	embedding dimension
tau	time delay
Logx	base of the logarithm in Shannon's formula for entropy. (this argument allows the entropy to be estimated in bits (base 2), nats (base e), dits (base 10), or whatever the user specifies)
Norm	normalisation of the entropy value as outlined in the source literature for that particular function.

All `Multiscale` and `Multiscale Cross`-entropy functions keyword arguments are identical.

One of the advantages of `EntropyHub` is the variety of keyword arguments available for many functions. For example, by specifying the **Typex** keyword argument when calling `PermEn`, one can calculate the edge, weighted, modified, amplitude-aware, fine-grained or uniform-quantization variants of permutation entropy, in addition to the original defined by Bandt and Pope [7]. Similarly, one can employ different fuzzy functions to transform state vector distances when calculating fuzzy entropy (`FuzzEn`) by specifying the **Fx** keyword argument. This ability to augment various parameters at the command line enables more advanced entropy methods to be performed with ease.

IMPORTANT NOTE

Although each function is complete with default arguments, blindly analysing time series data using these arguments is **strongly discouraged**. Inferring meaning about time series from entropy estimates is only valid when the parameters used accurately capture the underlying dynamics of the data.

Each function has a helpful description of its usage in the docstrings, explaining input parameters, outputs values and references to relevant source literature. To read the docstrings of a particular function, type:

MatLab	<code>help function-name</code>	e.g. <code>help PermEn</code>
Python	<code>help(EntropyHub.function-name)</code>	e.g. <code>help EntropyHub.PermEn</code>
Julia	<code>? function-name</code>	e.g. <code>? PermEn()</code>

BONUS

While the majority of multiscale and multiscale-cross functions available through `EntropyHub` have been previously published, options are available to call new multiscale variants, such as *multiscale cross-spectral entropy*.

Table 1.1: List of functions in the EntropyHub toolkit.

LET'S GET STARTED!

2

Installation

Stable releases of EntropyHub are available from the default package manager for MatLab (File Exchange), Python (PyPI) and Julia ([JuliaPackages](#)), while the latest version of EntropyHub can be downloaded or cloned from the [GitHub repository](#).

2.1 MatLab

System Requirements

There are two additional MatLab toolboxes required to exploit the *full* functionality of the EntropyHub toolkit:

Signal Processing Toolbox

Statistics and Machine Learning Toolbox.

however, most functions will work without these toolboxes.

EntropyHub is intended for use with MatLab versions $\geq 2016a$. In some cases the toolkit may work on versions 2015a and 2015b. However, it is not recommended to install on MatLab versions older than 2016 and should be done so with caution.

There are 3 ways to install EntropyHub for Matlab. Method 1 is the most straightforward.

Method 1.

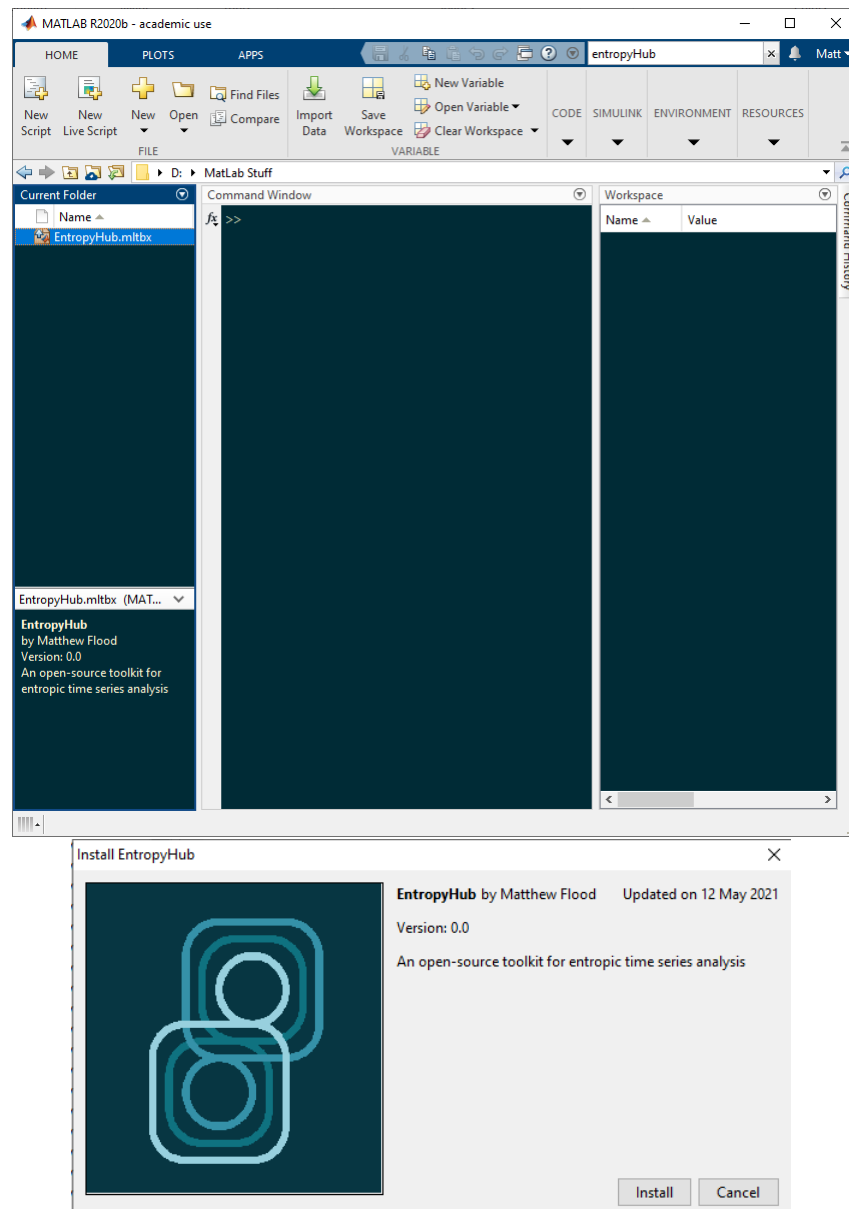

1. In MatLab, click the ‘Add-Ons’ button in the HOME tab. This should open the MatLab Add-On Explorer.

2. In the Add-On Explorer, search for 'EntropyHub'.
3. Open the link to EntropyHub and click the 'Add' button in the top right corner.
You may be asked to accept or decline the License Agreement prior to installation.

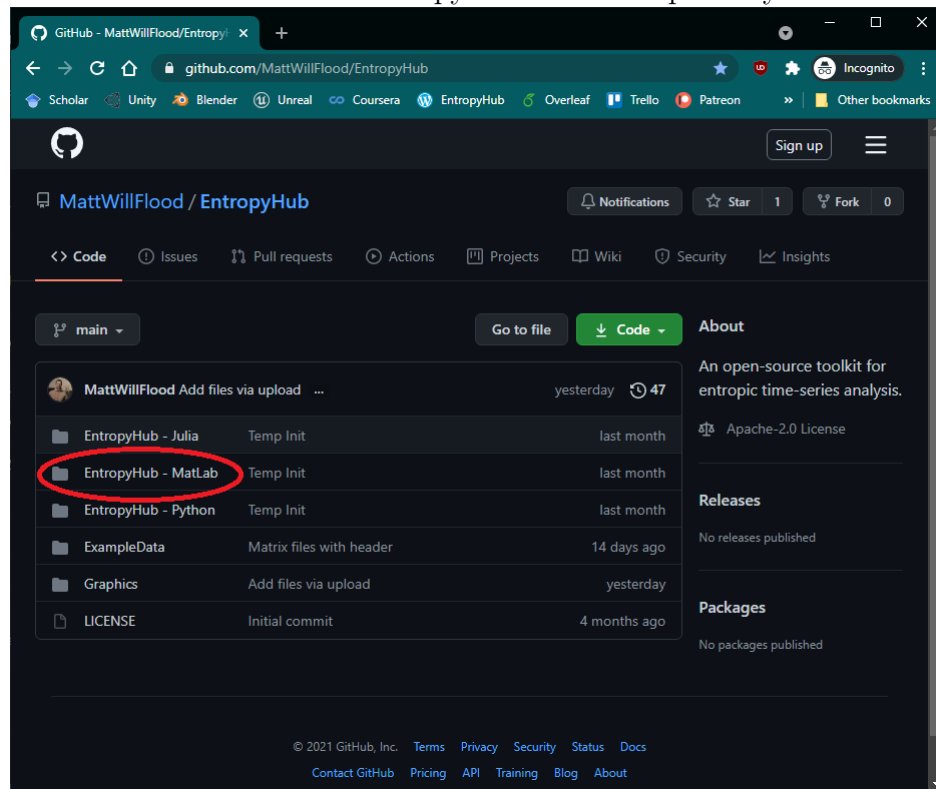

Method 2.

1. Visit the EntropyHub File Exchange page.
Note: you need to be logged in to your MathWorks account to continue.
2. Download the toolbox file (EntropyHub.mltbx) by clicking 'Toolbox' in the drop-down menu under the 'Download' button on the right hand side.
3. In MatLab, navigate the current folder to the directory where the EntropyHub.mltbx file is saved. Open the file and click install.

Method 3.

1. Go to the MatLab folder in the EntropyHub Github repository.

2. Download the toolbox file (EntropyHub.mltbx) by right clicking the link and selecting 'Save Link As...' (for Windows users).

3. In MatLab, navigate the current folder to the directory where the EntropyHub.mltbx file is saved. Open the file and click install.

2.2 Python

System Requirements

There are several package dependencies which will be installed alongside EntropyHub: Numpy, Scipy, Matplotlib, PyEMD, Requests

EntropyHub was designed using Python 3 and thus is not intended for use with Python 2. Python versions > 3.6 are required for using EntropyHub.

There are 2 ways to install EntropyHub for Python. Method 1 is **strongly recommended**.

Method 1.

1. Python comes with an inbuilt package management system, pip. Pip can install, update, or delete any official package. You can install packages via the command line by entering:

```
>>> pip install EntropyHub
```

If using a Python IDE, it is recommended to restart the terminal after installation.

2. To use EntropyHub, import the module with the following command:

```
>>> import EntropyHub
```

or in abbreviated form,

```
>>> import EntropyHub as EH
```

Method 2.

***Note:** installation with Method 2 requires the latest version of **wheel** to be previously installed in Python.

1. Visit the EntropyHub PyPI page (or the EntropyHub GitHub page). Download the latest .tar.gz folder (*EntropyHub.x.x.x.tar.gz*) from the ‘download files’ button on the left-hand side.

Extract the files into a local directory.

2. Open a command prompt or terminal window and navigate to the root directory where **setup.py** is located.

3. In the command line, enter:

```
>>> python setup.py install
```

*Ensure that an up-to-date version of `setuptools` is installed:

```
>>> python -m pip install --upgrade setuptools
```

4. To use EntropyHub, import the module with the following command:

```
>>> import EntropyHub
```

or in abbreviated form,

```
>>> import EntropyHub as EH
```

2.3 Julia

There are 2 ways to install EntropyHub in Julia. Method 1 is recommended.

Method 1.

1. In your Julia IDE, open the package REPL and enter:

```
julia> ]  
(@v1.X)> add EntropyHub
```

or alternatively:

```
using Pkg  
Pkg.add("EntropyHub")
```

2. To use EntropyHub in Julia, enter:

```
using EntropyHub
```

or import specific functions:

```
using EntropyHub: SampEn, MSobject, MSEN
```

Method 2.

1. Open the Julia package REPL and enter the following:

```
julia> ]  
(@v1.x)> add https://github.com/MattWillFlood/EntropyHub.jl
```

2. To use EntropyHub in Julia, enter:

```
using EntropyHub
```

or import specific functions:

```
using EntropyHub: SampEn, MSobject, MSEN
```

3

Functions

Sections 3.1 – 3.5 outline the command line syntax of each function with descriptions of every argument and returned value, as well as references to the source literature. The order of the function commands under the syntax subheading is MatLab first, Python second, Julia third.

NOTE

For concision, function commands written in the following sections using **Python** syntax exclude the module prefix which would otherwise be required, i.e. `EntropyHub.SampEn()` is written as `SampEn()`.

NOTE

Python functions in EntropyHub are based primarily on the Numpy module. Arguments in python functions with the **np.** prefix refer to numpy functions.

3.1 Base Entropy Functions

3.1.1 ApEn: Approximate Entropy

Syntax

```
[Ap, Phi] = ApEn(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
Ap, Phi = ApEn(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
Ap, Phi = ApEn(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signal, a vector of length > 10.
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
r	Distance threshold, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

Ap	Approximate entropy estimates, a vector of length m+1. **The first value of Ap is the zeroth estimate, i.e. $\frac{\text{Log}(N)}{N} - \Phi_1$, and the last value of Ap is the estimate for the specified m .
Phi	The number of matched state vectors for each embedding dimension from 0 to m+1.

<u>References</u>	[1]
-------------------	-----

3.1.2 **SampEn:** **Sample Entropy**

Syntax

```
[Samp, A, B] = SampEn(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
Samp, A, B = SampEn(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
Samp, A, B = SampEn(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
r	Distance threshold, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

Samp	Sample entropy estimates, a vector of length m+1 . **The first value of Samp is the zeroth estimate, i.e. $\frac{1}{N} \log(N(N-1)) - \log(A_1)$, and the last value of Samp is the estimate for the specified m .
A	The number of matched state vectors for each embedding dimension from 0 to m.
B	The number of matched state vectors for each embedding dimension from 1 to m+1.

References [\[2\]](#)

3.1.3 FuzzEn: Fuzzy Entropy

Syntax

```
[Fuzz, Ps1, Ps2] = FuzzEn(Sig, 'm', 2, 'tau', 1, 'Fx', 'default', 'r', [0.2,
2], 'Logx', exp(1))
Fuzz, Ps1, Ps2 = FuzzEn(Sig, m = 2, tau = 1, Fx = "default", r = (0.2, 2), Logx
= np.exp(1))
Fuzz, Ps1, Ps2 = FuzzEn(Sig, m = 2, tau = 1, Fx = "default", r = (0.2, 2), Logx
= exp(1))
```

Arguments

Sig Time series signal, a vector of length > 10.
m Embedding dimension, a positive integer.
tau Time delay, a positive integer.
Fx Type of fuzzy function for distance transformation, one of the following strings:
"default" $f(x) = \exp(-\frac{x^{r_2}}{r_1})$

"sigmoid"/"modsampe"

$$f(x) = (1 + \exp(\frac{x-r_2}{r_1}))^{-1}$$

"gudermannian"

$$g(x) = \text{atan}(\frac{\tanh(r_1)}{x})$$

$$f(x) = \frac{g(x)}{g(x_{max})}$$

Note: Distances are normalized w.r.t. maximum distance relative to each state vector.

"linear"

If $r = 0$:

$$f(x) = \exp\left(-\frac{x-x_{min}}{x_{max}-x_{min}}\right)$$

If $r = 1$:

$$f(x) = \exp(-(x - x_{min}))$$

r	Parameters of the fuzzy function specified by Fx , a 1 element scalar or a 2 element tuple of positive values depending on the fuzzy function as shown above.
Default	Two element tuple (or vector in MatLab)
Sigmoid/ModSampEn	Two element tuple (or vector in MatLab)
Gudermannian	A scalar value
Linear	0 or 1
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

Fuzz	Fuzzy entropy estimates for each embedding dimension 1:m.
Ps1	The average fuzzy distances for embedding dimensions 1:m.
Ps2	The average fuzzy distances for embedding dimensions 2:m+1.

<u>References</u>	[3] [4]
-------------------	---

3.1.4 K2En: Kolmogorov Entropy

Syntax

```
[K2, Ci] = K2En(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
K2, Ci = K2En(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
K2, Ci = K2En(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signal, a vector of length > 10.
m	Embedding dimension, an integer.
tau	Time delay, a positive integer.
r	Distance threshold, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

K2	Kolmogorov entropy estimates for each embedding dimension from 1 to m
Ci	The correlation sum for each embedding dimension from 1 to m.

References [\[5\]](#) [\[6\]](#)

3.1.5 PermEn: Permutation Entropy

Syntax

```
[Perm, Pnorm, cPE] = PermEn(Sig, 'm', 2, 'tau', 1, 'Typex', 'none', 'tpx', [],
'Logx', 2, 'Norm', false)
Perm, Pnorm, cPE = PermEn(Sig, m = 2, tau = 1, Typex = 'none', tpx = -1, Logx
= 2, Norm = False)
Perm, Pnorm, cPE = PermEn(Sig, m = 2, tau = 1, Typex = "none", tpx = nothing,
Logx = 2, Norm = false)
```

Arguments

Sig	Time series signal, a vector of length > 10.
m	Embedding dimension, an integer > 1.
tau	Time delay, a positive integer.
Typex	Variant of permutation entropy, one of the following strings: "finegrain" Fine-grained permutation entropy [8] "modified" Modified permutation entropy [9] "weighted" Weighted permutation entropy [10] "ampaware" Amplitude-aware permutation entropy [11] "edge" Edge permutation entropy [12] "uniquant" Uniform quantization-based permutation entropy [13]
tpx	Tuning parameter for the permutation entropy specified by the Typex argument. <i>finegrain</i> tpx is the α parameter, a positive scalar (default: 1) <i>ampaware</i> tpx is the A parameter, a value in range [0 1] (default: 0.5) <i>edge</i> tpx is the r sensitivity parameter, a scalar > 0 (default: 1) <i>uniquant</i> tpx is the L parameter, an integer > 1 (default: 4).
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalisation of Perm value, a boolean operator: false normalises w.r.t $\text{Log}(\# \text{ of permutation symbols } [m])$ - default true normalises w.r.t $\text{Log}(\# \text{ of all possible permutations } [m!])$ * Note: Normalised permutation entropy is undefined for $m = 1$. ** Note: When Typex = uniquant and Norm = true , normalisation of Perm is calculated w.r.t. $\text{Log}(tpx^m)$

Outputs

Perm	Permutation entropy estimates for embedding dimensions 1:m.
Pnorm	Normalised Permutation entropy estimates.
cPE	Conditional permutation entropy [14]

References [7] [8] [9] [10] [11] [12] [13] [14]

3.1.6 CondEn: *corrected* Conditional Entropy

Syntax

```
[Cond, SEw, SEz] = CondEn(Sig, 'm', 2, 'tau', 1, 'c', 6, 'Logx', exp(1), 'Norm',
false)
Cond, SEw, SEz = CondEn(Sig, m = 2, tau = 1, c = 6, Logx = np.exp(1), Norm =
False)
Cond, SEw, SEz = CondEn(Sig, m = 2, tau = 1, c = 6, Logx = exp(1), Norm = false)
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, an integer > 1 .
tau	Time delay, a positive integer.
c	Number of symbols in symbolic transformation, in integer > 1
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalization of Cond value:
	true no normalisation (default)
	false normalises w.r.t Shannon entropy of data sequence Sig

Outputs

Cond	Corrected conditional entropy estimate
SEw	Shannon entropy estimate for m .
SEz	Shannon entropy estimate for m+1 .

References [\[15\]](#)

3.1.7 **DistEn:** **Distribution Entropy**

Syntax

```
[Dist, Ppi] = DistEn(Sig, 'm', 2, 'tau', 1, 'Bins', 'sturges', 'Logx', 2, 'Norm',
true)
Dist, Ppi = DistEn(Sig, m = 2, tau = 1, Bins = 'sturges', Logx = 2, Norm = True)
Dist, Ppi = DistEn(Sig, m = 2, tau = 1, Bins = "sturges", Logx = 2, Norm = true)
```

Arguments

Sig	Time series signal, a vector of length > 10.
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
Bins	Histogram bin selection method, in integer > 1 indicating the number of bins, or one of the following strings: "sturges", "sqrt", "rice", "doanes" [default: "sturges"]
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. (Enter 0 for natural logarithm)
Norm	Normalization of Dist value: false no normalisation true normalises w.r.t number of histogram bins (default)

Outputs

Dist	Distribution entropy estimate.
Phi	Probability of each histogram bin.

References [\[16\]](#)

3.1.8 SpecEn: Spectral Entropy

Syntax

```
[Spec, BandEn] = SpecEn(Sig, 'N', 2*length(Sig)+1, 'Freqs', [0,1], 'Logx', exp(1),
'Norm', true)
Spec, BandEn = SpecEn(Sig, N = 2*len(Sig) + 1, Freqs = (0,1), Logx = np.exp(1),
Norm = True)
Spec, BandEn = SpecEn(Sig, N = 2*length(Sig) + 1, Freqs = (0,1), Logx = exp(1),
Norm = true)
```

Arguments

Sig Time series signal, a vector of length > 10.
N Resolution of the N-point fft, an integer > 1.
Freqs Normalised band edge-frequencies for calculating the band entropy (BandEn), a 2 element tuple with values in range [0,1] where 1 is the Nyquist frequency.
 * When no edge frequencies are provided, BandEn==SpecEn

Fs = 200, spectrum band [Freqs] = (0.4, 0.6)

Logx Logarithm base in Shannon's entropy formula, a positive scalar.
Norm Normalization of **Spec** value:
 false no normalisation
 true normalises **Spec** w.r.t number of Nyquist frequency value, and **BandEn** w.r.t. range of frequencies in the band given by Freqs. (default)

Outputs

Spec Spectral entropy estimate.
BandEn Spectral band entropy estimate.

References [\[17\]](#) [\[18\]](#)

3.1.9 DispEn: Dispersion Entropy

Syntax

```
[Dispx, RDE] = DispEn(Sig, 'm', 2, 'tau', 1, 'c', 3, 'Typex', 'ncdf', 'Logx',
exp(1), 'Fluct', false, 'Norm', false, 'rho', 1)
Dispx, RDE = DispEn(Sig, m = 2, tau = 1, c = 3, Typex = 'ncdf', Logx = exp(1),
Fluct = False, Norm = False, rho = 1)
Dispx, RDE = DispEn(Sig, m = 2, tau = 1, c = 3, Typex = "ncdf", Logx = exp(1),
Fluct = false, Norm = false, rho = 1)
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
c	Number of symbols in transform, an integer > 1 .
Typex	Type of symbolic sequence transform, one of the following strings: "ncdf" Normalised cumulative distribution function [19] "kmeans" K-means clustering algorithm. **Note: The "kmeans" algorithm uses random initialization conditions. This causes results to vary slightly each time it is called. "linear" Linear segmentation of signal range "finesort" Fine-sorted dispersion entropy [22] "equal" Approx. equal number of symbols.

Symbolic Sequence Transforms

Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Fluct	When true , returns the fluctuation-based dispersion entropy [20]
Norm	Normalisation of Dispx value, a boolean operator: false no normalisation true normalises w.r.t number of bins (default)
rho	*If Typex = "finesort", rho is the tuning parameter, a positive scalar (default: 1)

Outputs

Disp \mathbf{x} Dispersion entropy estimate.
RDE Reverse dispersion entropy estimate. [\[21\]](#)

References [\[19\]](#) [\[20\]](#) [\[21\]](#) [\[22\]](#)

3.1.10 SyDyEn: Symbolic Dynamic Entropy

Syntax

```
[SyDy, Zt] = SyDyEn(Sig, 'm', 2, 'tau', 1, 'c', 3, 'Typex', 'MEP', 'Logx', exp(1),
'Norm', true)
SyDy, Zt = SyDyEn(Sig, m = 2, tau = 1, c = 3, Typex = 'MEP', Logx = np.exp(1),
Norm = True)
SyDy, Zt = SyDyEn(Sig, m = 2, tau = 1, c = 3, Typex = "MEP", Logx = exp(1), Norm
= true)
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
c	Number of symbols, an integer > 1 .
Typex	Type of symbolic sequence partitioning, one of the following strings: <div> <div>"MEP"</div> <div>Maximum entropy partitioning [24]</div> <div>"kmeans"</div> <div>K-means clustering algorithm.</div> <div></div> <div>*Note: The "kmeans" algorithm uses random initialization conditions. This causes results to vary slightly when repeatedly called.</div> <div>"linear"</div> <div>Linear segmentation of signal range</div> <div>"uniform"</div> <div>Approx. equal number of symbols.</div> </div>

Symbolic Sequence Transforms

Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalisation of SyDy value, a boolean operator: <div> <div>false</div> <div>no normalisation</div> <div>true</div> <div>normalises w.r.t number of possible vector permutations (c^{m+1})</div> </div>

Outputs

SyDy	Symbolic Dynamic entropy estimate.
zt	Symbolic sequence of transformed time series.

<u>References</u>	[23] [24] [25]
-------------------	--

3.1.11 **IncrEn:** Increment Entropy

Syntax

```
Incr = IncrEn(Sig, 'm', 2, 'tau', 1, 'R', 4, 'Logx', exp(1), 'Norm', false)
Incr = IncrEn(Sig, m = 2, tau = 1, R = 4, Logx = np.exp(1), Norm = False)
Incr = IncrEn(Sig, m = 2, tau = 1, R = 4, Logx = exp(1), Norm = false)
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, an integer > 1 .
tau	Time delay, a positive integer.
R	Quantifying resolution, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalisation of Incr value.
	false no normalisation (default)
	true normalises w.r.t. embedding dimension (m-1)

Outputs

Incr	Increment entropy estimate.
-------------	-----------------------------

<u>References</u>	[26] [27] [28]
-------------------	--

3.1.12 CoSiEn: Cosine Similarity EntropySyntax

```
[CoSi, Bm] = CoSiEn(Sig, 'm', 2, 'tau', 1, 'r', 0.1, 'Logx', 2, 'Norm', 0)
CoSi, Bm = CoSiEn(Sig, m = 2, tau = 1, r = 0.1, Logx = 2, Norm = 0)
CoSi, Bm = CoSiEn(Sig, m = 2, tau = 1, r = 0.1, Logx = 2, Norm = 0)
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, an integer > 1 .
tau	Time delay, a positive integer.
r	Angular threshold, a value in range $[0 < \mathbf{r} < 1]$
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalisation of Sig , an interger in range $[0 \ 4]$: 0 - no normalisation (default) 1 - median removed 2 - mean removed 3 - normalised by standard deviation 4 - normalised to range $[-1 \ 1]$

Outputs

CoSi	Cosine similarity entropy estimate.
Bm	Global probabilities.

<u>References</u>	[29]
-------------------	----------------------

3.1.13 PhasEn: Phase Entropy

Syntax

```
Phas = PhasEn(Sig, 'K', 4, 'tau', 1, 'Logx', exp(1), 'Norm', true, 'Plotx', false)
Phas = PhasEn(Sig, K = 4, tau = 1, Logx = np.exp(1), Norm = True, Plotx = False)
Phas = PhasEn(Sig, K = 4, tau = 1, Logx = exp(1), Norm = true, Plotx = false)
```

Arguments

Sig Time series signal, a vector of length > 10 .

K Number of angular partitions, an integer > 1 .
****Note:** Angular partitions of the second-order difference plot (SODP) are first split between 0 and n degrees w.r.t. the positive x-axis.

tau Time delay, a positive integer.

Logx Logarithm base in Shannon's entropy formula, a positive scalar.

Norm Normalisation of **Phas**:
false no normalisation (default)
true normalises w.r.t. the number of partitions **Log (K)**

Plotx When **Plotx** == true, returns SODP (default: false)
The example below depicts the SODP of normally distributed random numbers with 7 angular partitions (**K**).

Outputs

Phas Phase entropy estimate.

References [\[30\]](#)

3.1.14 SlopEn: Slope EntropySyntax

```
Slop = SlopEn(Sig, 'm', 2, 'tau', 1, 'Logx', 2, 'Lvls', [5, 45], 'Norm', true)
Slop = SlopEn(Sig, m = 2, tau = 1, Logx = 2, Lvls = (5, 45), Norm = True)
Slop = SlopEn(Sig, m = 2, tau = 1, Logx = 2, Lvls = [5, 45], Norm = true)
```

Arguments

Sig	Time series signal, a vector of length > 10.
m	Embedding dimension, an integer > 1.
tau	Time delay, a positive integer.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. Enter 0 for natural logarithm.
Lvls	Angular thresholds, a vector (or tuple in python) of monotonically increasing values in the range [0 90] degrees
Norm	Normalisation of Slop : false no normalisation true normalises w.r.t. the number of unique patterns found.

Outputs

Slop	Slope entropy estimates, a vector of length m-1 where values correspond to embedding dimensions [2, ..., m]
-------------	---

<u>References</u>	[31]
-------------------	----------------------

3.1.15 Bubben: Bubble Entropy

Syntax

```
[Bubb, H] = Bubben(Sig, 'm', 2, 'tau', 1, 'Logx', exp(1))
Bubb, H = Bubben(Sig, m = 2, tau = 1, Logx = np.exp(1))
Bubb, H = Bubben(Sig, m = 2, tau = 1, Logx = exp(1))
```

Arguments

Sig	Time series signal, a vector of length > 10 .
m	Embedding dimension, an integer > 1 .
tau	Time delay, a positive integer.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

Bubb	Bubb entropy estimate.
H	Conditional Rényi entropy

References [\[32\]](#)

3.1.16 GridEn: Gridded Distribution Entropy

Syntax

```
[GDE, GDR, PIdx, GIdx, SIdx, AIdx] = GridEn(Sig, 'm', 3, 'tau', 1, 'Logx', exp(1),
'Plotx', false)
GDE, GDR, PIdx, GIdx, SIdx, AIdx = GridEn(Sig, m = 3, tau = 1, Logx = np.exp(1),
Plotx = False)
GDE, GDR, PIdx, GIdx, SIdx, AIdx = GridEn(Sig, m = 3, tau = 1, Logx = exp(1), Plotx
= false)
```

Arguments

Sig Time series signal, a vector of length > 10 .
m Embedding dimension, an integer > 1 .
tau Time delay, a positive integer.
Logx Logarithm base in Shannon's entropy formula, a positive scalar.
Plotx When `Plotx == true`, returns Poincaré plot and a bivariate histogram of the grid point distribution (default: `false`)

Poincaré plot and bivariate histogram of uniform random number sequence ($m = 4$).

Poincaré plot and bivariate histogram of white noise ($m = 7$).

Outputs

GDE Gridded distribution entropy estimate.
GDR Gridded distribution rate.
PIdx Percentage of points below the line of identity (LI). [35]
GIdx Proportion of point distances above the LI. [37]
SIdx Ratio of phase angles (w.r.t. LI) of the points above the LI. [36]
AIdx Ratio of the cumulative area of sectors of points above the LI. [34]

References

[33] [34] [35] [36] [37]

3.1.17 EnofEn: Entropy of EntropySyntax

```
[EoE, AvEn] = EnofEn(Sig, 'tau', 10, 'S', [10,5], 'Logx', exp(1))
EoE, AvEn = EnofEn(Sig, tau = 10, S = (10,5), Logx = np.exp(1))
EoE, AvEn = EnofEn(Sig, tau = 10, S = (10,5), Logx = exp(1))
```

Arguments

Sig	Time series signal, a vector of length > 10.
tau	Window length, an integer > 1.
S	Number of slices (s1,s2), a two-element tuple of integers > 2
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

EoE	Entropy of entropy estimate.
AvEn	Average Shannon entropy across all windows

References [\[38\]](#)

3.1.18 AttnEn: Attention EntropySyntax

```
[Attn, Hxx, Hnn, Hxn, Hnx] = EnofEn(Sig, 'Logx', 2)
Attn, Hxx, Hnn, Hxn, Hnx = EnofEn(Sig, Logx = 2)
Attn, Hxx, Hnn, Hxn, Hnx = EnofEn(Sig, Logx = 2)
```

Arguments

Sig	Time series signal, a vector of length > 10.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. Enter 0 for natural logarithm.

Outputs

Attn	Attention entropy estimate.
Hxx	Entropy of local-maxima intervals
Hnn	Entropy of local-minima intervals
Hxn	Entropy of intervals between local maxima and subsequent minima
Hnx	Entropy of intervals between local minima and subsequent maxima

<u>References</u>	[39]
-------------------	----------------------

3.2 Cross-Entropy Functions

3.2.1 XApEn: Cross-Approximate Entropy

Syntax

```
[XAp, Phi] = XApEn(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
XAp, Phi = XApEn(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
XAp, Phi = XApEn(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signals, a $N \times 2$ matrix where $N > 10$. NOTE: XApEn is direction-dependent. Thus, the first column of Sig is used as the template data sequence, and the second column is the matching sequence.
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
r	Distance threshold, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

XAp	Cross-approximate entropy estimates, a vector of length $m+1$. **The first value of XAp is the zeroth estimate, i.e. $(\log(N)/N) - \Phi_1$, and the last value of XAp is the estimate for the specified m .
Phi	The number of matched state vectors for each embedding dimension from 0 to $m+1$.

<u>References</u>	[1]
-------------------	-----

3.2.2 XSampEn: Cross-Sample Entropy

Syntax

```
[XSamp, Phi] = XSampEn(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
XSamp, Phi = XSampEn(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
XSamp, Phi = XSampEn(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
r	Radius distance threshold, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

XSamp	Cross-sample entropy estimates, a vector of length m+1. **The first value of XSamp is the zeroth estimate, i.e. $\frac{\text{Log}(N(N-1))}{N} - \text{Log}(A_1)$, and the last value of XSamp is the estimate for the specified m .
A	The number of matched state vectors for each embedding dimension from 0 to m.
B	The number of matched state vectors for each embedding dimension from 1 to m+1.

References [\[2\]](#)

3.2.3 XFuzzEn: Cross-Fuzzy Entropy

Syntax

```
[XFuzz, Ps1, Ps2] = XFuzzEn(Sig, 'm', 2, 'tau', 1, 'Fx', 'default', 'r', [0.2,
2], 'Logx', exp(1))
XFuzz, Ps1, Ps2 = XFuzzEn(Sig, m = 2, tau = 1, Fx = 'default', r = (0.2, 2),
Logx = np.exp(1))
XFuzz, Ps1, Ps2 = XFuzzEn(Sig, m = 2, tau = 1, Fx = "default", r = (0.2, 2),
Logx = exp(1))
```

Arguments

Sig Time series signals, a N x 2 matrix where N > 10.
m Embedding dimension, a positive integer.
tau Time delay, a positive integer.
Fx Type of fuzzy function for distance transformation, one of the following strings:
"default" $f(x) = \exp(-\frac{x^{r_2}}{r_1})$

"sigmoid"/"modsampen"

$$f(x) = (1 + \exp(\frac{x-r_2}{r_1}))^{-1}$$

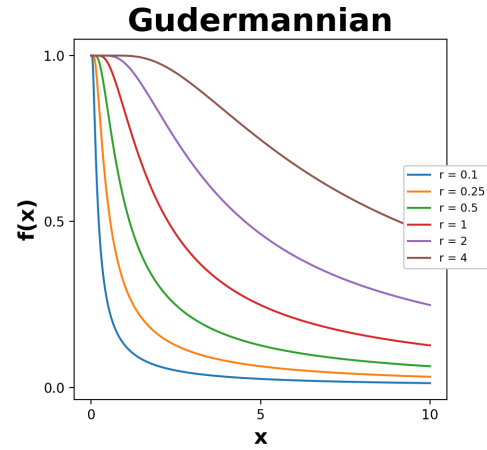

"gudermannian"

$$g(x) = \operatorname{atan}\left(\frac{\tanh(r_1)}{x}\right)$$

$$f(x) = \frac{g(x)}{g(x_{max})}$$

Note: Distances are normalized w.r.t. maximum distance relative to each state vector.

"linear"

If $\mathbf{r} = 0$:

$$f(x) = \exp\left(-\frac{x - x_{min}}{x_{max} - x_{min}}\right)$$

 If $\mathbf{r} = 1$:

$$f(x) = \exp(-(x - x_{min}))$$

r	Parameters of the fuzzy function specified by Fx , a 1 element scalar or a 2 element tuple of positive values depending on the fuzzy function as shown above.
Default	Two element tuple (or vector in MatLab)
Sigmoid/ModSampEn	Two element tuple (or vector in MatLab)
Gudermannian	A scalar value
Linear	0 or 1
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

XFuzz	Cross-fuzzy entropy estimates for each embedding dimension from 1 to m.
Ps1	The average fuzzy distances for embedding dimensions from 1 to m.
Ps2	The average fuzzy distances for embedding dimensions from 2 to m+1.

<u>References</u>	[40]
-------------------	------

3.2.4 XK2En: Cross-Kolmogorov Entropy

Syntax

```
[XK2, Ci] = XK2En(Sig, 'm', 2, 'tau', 1, 'r', 0.2*std(Sig), 'Logx', exp(1))
XK2, Ci = XK2En(Sig, m = 2, tau = 1, r = 0.2*np.std(Sig), Logx = np.exp(1))
XK2, Ci = XK2En(Sig, m = 2, tau = 1, r = 0.2*std(Sig), Logx = exp(1))
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
m	Embedding dimension, a positive integer.
tau	Time delay, a positive integer.
r	Distance threshold value, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.

Outputs

XK2	Cross-Kolmogorov entropy estimates for each embedding dimension from 1 to m
Ci	The correlation sum for each embedding dimension from 1 to m.

References [\[66\]](#)

3.2.5 XPermEn: Cross-Permutation Entropy

Syntax

```
[XPerm] = XPermEn(Sig, 'm', 3, 'tau', 1, 'Logx', 2)
XPerm = XPermEn(Sig, m = 3, tau = 1, Logx = 2)
XPerm = XPermEn(Sig, m = 3, tau = 1, Logx = 2)
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
m	Embedding dimension, an integer > 2. NOTE: XPerm is undefined for m < 3.
tau	Time delay, a positive integer.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. (Enter 0 for natural logarithm)

Outputs

XPerm	Cross-permutation entropy estimate.
--------------	-------------------------------------

<u>References</u>	[41]
-------------------	----------------------

3.2.6 XCondEn: Cross-Conditional Entropy

Syntax

```
[XCond, SEw, SEz] = XCondEn(Sig, 'm', 2, 'tau', 1, 'c', 6, 'Logx', exp(1), 'Norm',
false)
XCond, SEw, SEz = XCondEn(Sig, m = 2, tau = 1, c = 6, Logx = np.exp(1), Norm
= False)
XCond, SEw, SEz = XCondEn(Sig, m = 2, tau = 1, c = 6, Logx = exp(1), Norm = false)
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10. NOTE: XCondEn is direction-dependent. Therefore, the order of the data sequences in Sig matters. If the first column of Sig is the sequence 'y', and the second column is the sequence 'u', XCond is the amount of information carried by y(i) when the pattern u(i) is found.
m	Embedding dimension, an integer > 1.
tau	Time delay, a positive integer.
c	Number of symbols in symbolic transformation, in integer > 1
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalization of XCond value: true no normalisation (default) false normalises w.r.t cross-Shannon entropy.

Outputs

XCond	Corrected Cross-Conditional entropy estimate.
SEw	Cross-Shannon entropy estimate for m .
SEz	Cross-Shannon entropy estimate for m+1 .

<u>References</u>	[15]
-------------------	----------------------

3.2.7 XDistEn: Cross-Distribution Entropy

Syntax

```
[XDist, Ppi] = XDistEn(Sig, 'm', 2, 'tau', 1, 'Bins', 'sturges', 'Logx', 2, 'Norm',
true)
XDist, Ppi = XDistEn(Sig, m = 2, tau = 1, Bins = 'sturges', Logx = 2, Norm =
True)
XDist, Ppi = XDistEn(Sig, m = 2, tau = 1, Bins = "sturges", Logx = 2, Norm =
true)
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
m	Embedding dimension, an integer > 1.
tau	Time delay, a positive integer.
Bins	Histogram bin selection method, in integer > 1 indicating the number of bins, or one of the following strings: "sturges", "sqrt", "rice", "doanes" [default: "sturges"]
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. (Enter 0 for natural logarithm)
Norm	Normalization of XDist value: false no normalisation true normalises w.r.t number of histogram bins (default)

Outputs

XDist	Cross-Distribution entropy estimate.
Ppi	Probability of each histogram bin.

<u>References</u>	[16]
-------------------	------

3.2.8 XSpecEn: Cross-Spectral Entropy

Syntax

```
[XSpec, BandEn] = XSpecEn(Sig, 'N', 2*length(Sig)+1, 'Freqs', [0,1], 'Logx',
exp(1), 'Norm', true)
XSpec, BandEn = XSpecEn(Sig, N = 2*len(Sig) + 1, Freqs = (0,1), Logx = np.exp(1),
Norm = True)
XSpec, BandEn = XSpecEn(Sig, N = 2*length(Sig) + 1, Freqs = (0,1), Logx = exp(1),
Norm = true)
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
N	Resolution of the N-point fft, an integer > 1.
Freqs	Normalised band edge-frequencies for calculating the band entropy (BandEn), a 2 element tuple with values in range [0, 1] where 1 is the Nyquist frequency. * When no edge frequencies are provided, BandEn==XSpecEn
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Norm	Normalization of XSpec value: false no normalisation true normalises XSpec w.r.t number of Nyquist frequency values, and BandEn w.r.t. range of frequencies in the band given by Freqs . (default)

Outputs

XSpec	Cross-Spectral entropy estimate.
BandEn	Cross-Spectral band entropy estimate.

<u>References</u>	[66]
-------------------	------

3.3 Multiscale Entropy Functions

A key advantage of the EntropyHub toolkit is that so many variants of multiscale entropy can be easily calculated using any of the **Base** entropy functions. This is achieved using a multiscale entropy object (**Mobj**), returned by **MSobject()**, to specify the type of entropy and its parameters.

Multiscale entropy functions have two positional arguments:
the time series signal **Sig**, and
the multiscale entropy object, **Mobj**.

Examples (shown in Julia syntax):

Original multiscale entropy [42]

```
Mobj = MSobject("SampEn")
mse = MSEN(Sig, Mobj)
```

Time-shifted multiscale approximate entropy with varying tolerance across scales [43]

```
Mobj = MSobject("ApEn", m = 5, r = 0.25)
mse = MSEN(Sig, Mobj, Methodx = "timeshift", RadNew = 1)
```

Composite multiscale conditional entropy with a 10-symbol data sequence, calculated up to 5 temporal scales [?]

```
Mobj = MSobject("CondEn", m = 5, c = 10)
cmse = cMSEN(Sig, Mobj, scales = 5)
```

Refined-Composite multiscale entropy calculated in bits [?]

```
Mobj = MSobject("SampEn", Logx = 2)
rcmse = cMSEN(Sig, Mobj, Refined = true)
```

Refined multiscale fuzzy entropy calulated using a sigmoidal fuzzy function and a time delay of 4

```
Mobj = MSobject("FuzzEn", tau = 4, Fx = "sigmoid")
rmse = rMSEN(Sig, Mobj)
```

Hierarchical multiscale edge permutation entropy with an 'r' sensitivity parameter = 2.66 normalized w.r.t. the number of symbols (4), and calculated up to 5 hierarchical scales

```
Mobj = MSobject("PermEn", m = 4, Typex = "edge", tpx = 2.66, Norm = true)
hmse = hMSEN(Sig, Mobj, scale = 5)
```

3.3.1 MSobject: Multiscale Entropy Object

Syntax

```
Mobj = MSobject(EnType, varargin)
Mobj = MSobject(EnType, **kwargs)
Mobj = MSobject(EnType::Function, kwargs...)
```

Arguments

<p>EnType</p>	<p>In MatLab and Python, EnType is a case-sensitive string corresponding to a valid Base or Cross- entropy function, e.g. 'SyDyEn' or 'XDistEn', etc.</p> <p>In Julia, EnType is a Base or Cross- entropy Function object, e.g. <code>EntropyHub.ApEn</code> (or <code>ApEn</code> if imported independently), or <code>XSpecEn</code>, etc.</p>
<p>varargin **kwargs kwargs...</p>	<p>Any valid keyword arguments (Name/Value pairs) for the entropy function specified by EnType</p>

Outputs

Mobj Multiscale Entropy object.

3.3.2 MSEN: Multiscale Entropy

Syntax

```
[MSx, Ci] = MSEN(Sig, 'Scales', 3, 'Methodx', 'coarse', 'RadNew', 0, 'Plotx',
false)
MSx, Ci = MSEN(Sig, Scales = 3, Methodx = 'coarse', RadNew = 0, Plotx = False)
MSx, Ci = MSEN(Sig, Scales = 3, Methodx = "coarse", RadNew = 0, Plotx = false)
```

Arguments

Sig Time series signals, a vector of length > 10 .
Scales Number of grained time scales, a positive integer.
Methodx Type of graining method, one of the following strings:
"coarse" [42]

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{i=(j-1)\tau+1}^{j\tau} x_i, \quad 1 \leq j \leq \frac{N}{\tau}$$

"modified"

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{k=0}^{\tau-1} x_{j-k}, \quad 1 \leq j \leq N - \tau + 1$$

"timeshift" [51]

$$y_{\beta}^{\tau} = (x_{\beta}, x_{\beta+\tau}, x_{\beta+2\tau}, \dots, x_{\beta+\lfloor \frac{N-\beta}{\tau} \rfloor \tau}) \quad \text{for } \beta = 1, 2, \dots, \tau$$

$$TSME_{\tau} = \frac{1}{\tau} \sum_{\beta=1}^{\tau} F_{EnType}(y_{\beta}^{\tau})$$

"imf" Grained time series at scale τ is the cumulative sum of intrinsic mode functions (IMF^1 to IMF^{τ}), where IMF^1 is the first sifting. [47]
***Note:** The empirical mode decomposition method use to derive the IMFs differs slightly between **MatLab**, **Python** and **Julia**, so **MSx** values will be inconsistent between the environment.
****Note: Julia's** empirical mode decomposition method is unstable and may not fully decompose highly stochastic or aperiodic signals.

RadNew Radius rescaling method, an integer in the range $[0 \ 4]$.
When the **Base** entropy method specified by **Mobj** is **SampEn** or **ApEn**, **RadNew** allows the radius threshold to be updated based on the grained signal at each time scale (X_{τ}). If a radius threshold value (**r**) is specified in **Mobj**, this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of **RadNew** specifies one of the following methods:

0	no rescaling
1	Standard Deviation - $r\sigma_{X_{\tau}}$
2	Variance - $r\sigma_{X_{\tau}}^2$
3	Mean Absolute Deviation - $r(\frac{1}{N} \sum X_{\tau} - \bar{X}_{\tau})$
4	Median Absolute Deviation - $r(\text{median}(X_{\tau} - \text{median}(X_{\tau})))$

Plotx A plot of the multiscale entropy curve
true Plots time scale vs entropy value.
false No plot.

An example multiscale entropy curve of a normally distributed random number sequence using sample entropy over 5 coarse-grained time scales.

Outputs

MSx Multiscale entropy estimate at each time scale (τ), a vector of length **Scales**.
Ci Complexity index (area under the multiscale entropy curve), a scalar.

3.3.3 cMSEn: Composite & Refined-Composite Multiscale Entropy

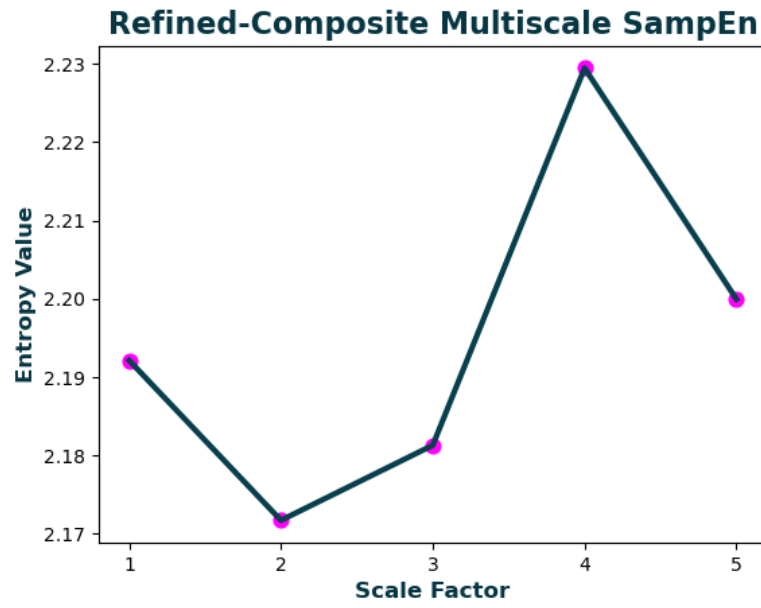

Syntax

```
[MSx, Ci] = cMSEn(Sig, 'Scales', 3, 'RadNew', 0, 'Refined', false, 'Plotx', false)
MSx, Ci = cMSEn(Sig, Scales = 3, RadNew = 0, Refined = False, Plotx = False)
MSx, Ci = cMSEn(Sig, Scales = 3, RadNew = 0, Refined = false, Plotx = false)
```

Arguments

Sig	Time series signals, a vector of length > 10 .
Scales	Number of time scales, a positive integer.
RadNew	Radius rescaling method, an integer in the range $[0\ 4]$. When the Base entropy method specified by Mobj is SampEn or ApEn , RadNew allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (r) is specified in Mobj , this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of RadNew specifies one of the following methods: <ol style="list-style-type: none"> 0 no rescaling 1 Standard Deviation - $r\sigma_{X_\tau}$ 2 Variance - $r\sigma_{X_\tau}^2$ 3 Mean Absolute Deviation - $r(\frac{1}{N} \sum X_\tau - \bar{X}_\tau)$ 4 Median Absolute Deviation - $r(\text{median}(X_\tau - \text{median}(X_\tau)))$
Refined	When Refined == true and the entropy function (EnType) contained in Mobj is SampEn , cMSEn returns the refined-composite multiscale entropy (rcMSEn). [54]
Plotx	A plot of the multiscale entropy curve true Plots time scale vs entropy value. false No plot. <i>Example of composite multiscale entropy and refined-composite multiscale entropy curves for normally distributed random number sequences using sample entropy over 5 time scales.</i>

Outputs

- MSx** Composite multiscale entropy estimate at each time scale (τ), a vector of length **Scales**.
- ci** Complexity index (area under the multiscale entropy curve), a scalar.

3.3.4 rMSEn: Refined Multiscale Entropy

Syntax

```
[MSx, Ci] = rMSEn(Sig, 'Scales', 3, 'F_Order', 6, 'F_Num', 0.5, 'RadNew', 0, 'Plotx',
false)
MSx, Ci = rMSEn(Sig, Scales = 3, F_Order = 6, F_Num = 0.5, RadNew = 0, Plotx =
False)
MSx, Ci = rMSEn(Sig, Scales = 3, F_Order = 6, F_Num = 0.5, RadNew = 0, Plotx =
false)
```

Arguments

Sig	Time series signals, a vector of length > 10 .
Scales	Number of time scales, an integer > 0 .
F_Order	Butterworth low-pass filter order, a positive integer > 1 , (default: 6)
F_Num	Numerator of Butterworth low-pass filter cutoff frequency, where $[0 < F_{Num} < 1]$. The cutoff frequency at each scale (τ) becomes: $F_c = \frac{F_{Num}}{\tau}$ (default: 0.5)
RadNew	Radius rescaling method, an integer in the range $[0 \ 4]$. When the Base entropy method specified by Mobj is SampEn or ApEn , RadNew allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (r) is specified in Mobj , this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of RadNew specifies one of the following methods: 0 no rescaling 1 Standard Deviation - $r\sigma_{X_\tau}$ 2 Variance - $r\sigma_{X_\tau}^2$ 3 Mean Absolute Deviation - $r(\frac{1}{N} \sum X_\tau - \bar{X}_\tau)$ 4 Median Absolute Deviation - $r(\text{median}(X_\tau - \text{median}(X_\tau)))$
Plotx	A plot of the multiscale entropy curve true Plots time scale vs entropy value. false No plot. <i>Example of a refined multiscale entropy curve for a normally distributed random number sequence using sample entropy over 5 time scales.</i>

Outputs

MSx Refined multiscale entropy estimate at each time scale (τ), a vector of length **Scales**.
Ci Complexity index (area under the multiscale entropy curve), a scalar.

3.3.5 hMSEn: Hierarchical Multiscale Entropy

Syntax

```
[MSx, Sn, Ci] = hMSEn(Sig, 'Scales', 3, 'RadNew', 0, 'Plotx', false)
MSx, Sn, Ci = hMSEn(Sig, Scales = 3, RadNew = 0, Plotx = False)
MSx, Sn, Ci = hMSEn(Sig, Scales = 3, RadNew = 0, Plotx = false)
```

Arguments

Sig Time series signal, a vector of length > 10 .
The length of **Sig** (K) is halved at each scale. Only use the first 2^N data points are used such that $\min(K - 2^N)$.
i.e. For a signal of 5000 points, only the first 4096 points are used. For a signal of 1500 points, only the first 1024 points are used.

Scales Number of time scales, an integer > 0 .

RadNew Radius rescaling method, an integer in the range $[0\ 4]$.
When the **Base** entropy method specified by **Mobj** is **SampEn** or **ApEn**, **RadNew** allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (**r**) is specified in **Mobj**, this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of **RadNew** specifies one of the following methods:

0	no rescaling
1	Standard Deviation - $r\sigma_{X_\tau}$
2	Variance - $r\sigma_{X_\tau}^2$
3	Mean Absolute Deviation - $r(\frac{1}{N} \sum X_\tau - \bar{X}_\tau)$
4	Median Absolute Deviation - $r(\text{median}(X_\tau - \text{median}(X_\tau)))$

Plotx A plot of the multiscale entropy curve
true Plots a curve of the average entropy value at each time scale (i.e. the multiscale entropy curve) and a hierarchical graph showing the entropy value of each node in the hierarchical tree decomposition.
false No plot.

Example of a multiscale entropy curve and a hierarchical tree graph for a normally distributed random number sequence using sample entropy over 4 time scales.

Outputs

MSx	Entropy estimate at each node in the hierarchical tree, a vector of length $2^{\text{Scales}} - 1$.
Sn	Average entropy value across each scale of hierarchical tree, a vector of length Scales .
Ci	Complexity index (area under the multiscale entropy curve), a scalar.

3.4 Multiscale Cross-Entropy Functions

Just as one can calculate multiscale entropy using any Base entropy, the same functionality is possible with multiscale cross-entropy using any Cross-entropy function (**XApEn**, **XSampEn**, **XK2En**, **XCondEn**, **XPermEn**, **XSpecEn**, **XDistEn**, **XFuzzEn**). To do so, we again use the **MSObject** function to pass a multiscale object (**Mobj**) to the multiscale cross-entropy functions.

Multiscale cross-entropy functions have two positional arguments:

the time series signals **Sig** (an Nx2 matrix),
and the multiscale entropy object, **Mobj**.

Examples (shown in Julia syntax):

Original multiscale cross-entropy [42]

```
Mobj = MSObject("XSampEn")
xmse = XMSEn(Sig, Mobj)
```

Multiscale cross-distribution entropy using Rice's binning method and signal graining with empirical mode decomposition [47] [16]

```
Mobj = MSObject("XDistEn", Bins = "rice")
xmse = XMSEn(Sig, Mobj, Methodx = "imf")
```

Composite multiscale cross-conditional entropy with a 10-symbol data sequence, calculated up to 5 temporal scales [53] [15]

```
Mobj = MSObject("XCondEn", m = 5, c = 10)
cxmse = cXMSEn(Sig, Mobj, scales = 5)
```

Refined-Composite multiscale cross-entropy calculated in dits [?]

```
Mobj = MSObject("XSampEn", Logx = 10)
rcxmse = cXMSEn(Sig, Mobj, Refined = true)
```

Refined multiscale cross-permutation entropy calculated using an embedding dimension of 4 and a time delay of 4

```
Mobj = MSObject("XPermEn", m = 4, tau = 4)
rxmse = rXMSEn(Sig, Mobj)
```

3.4.1 MSobject: Multiscale Entropy Object

Syntax

```
Mobj = MSobject(EnType, varargin)
Mobj = MSobject(EnType, **kwargs)
Mobj = MSobject(EnType::Function, kwargs...)
```

Arguments

EnType	In MatLab and Python , EnType is a case-sensitive string corresponding to a valid Base or Cross- entropy function, e.g. 'SyDyEn' or 'XDistEn', etc.
	In Julia , EnType is a Base or Cross- entropy Function object, e.g. <code>EntropyHub.XApEn</code> (or <code>XApEn</code> if imported independently) etc.
varargin **kwargs kwargs...	Any valid keyword arguments (Name/Value pairs) for the entropy function specified by EnType

Outputs

Mobj	Multiscale Entropy object.
-------------	----------------------------

3.4.2 XMSEn: Multiscale Cross-Entropy

Syntax

```
[MSx, Ci] = XMSEn(Sig, 'Scales', 3, 'Methodx', 'coarse', 'RadNew', 0, 'Plotx',
false)
MSx, Ci = XMSEn(Sig, Scales = 3, Methodx = 'coarse', RadNew = 0, Plotx = False)
MSx, Ci = XMSEn(Sig, Scales = 3, Methodx = "coarse", RadNew = 0, Plotx = false)
```

Arguments

Sig Time series signals, a $N \times 2$ matrix where $N > 10$.
Scales Number of grained time scales, a positive integer.
Methodx Type of graining method, one of the following strings:
"coarse" [42]

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{i=(j-1)\tau+1}^{j\tau} x_i, \quad 1 \leq j \leq \frac{N}{\tau}$$

"modified"

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{k=0}^{\tau-1} x_{j-k}, \quad 1 \leq j \leq N - \tau + 1$$

"timeshift" [51]

$$y_\beta^\tau = (x_\beta, x_{\beta+\tau}, x_{\beta+2\tau}, \dots, x_{\beta+\lfloor \frac{N-\beta}{\tau} \rfloor \tau}) \quad \text{for } \beta = 1, 2, \dots, \tau$$

$$TSME_\tau = \frac{1}{\tau} \sum_{\beta=1}^{\tau} F_{EnType}(y_\beta^\tau)$$

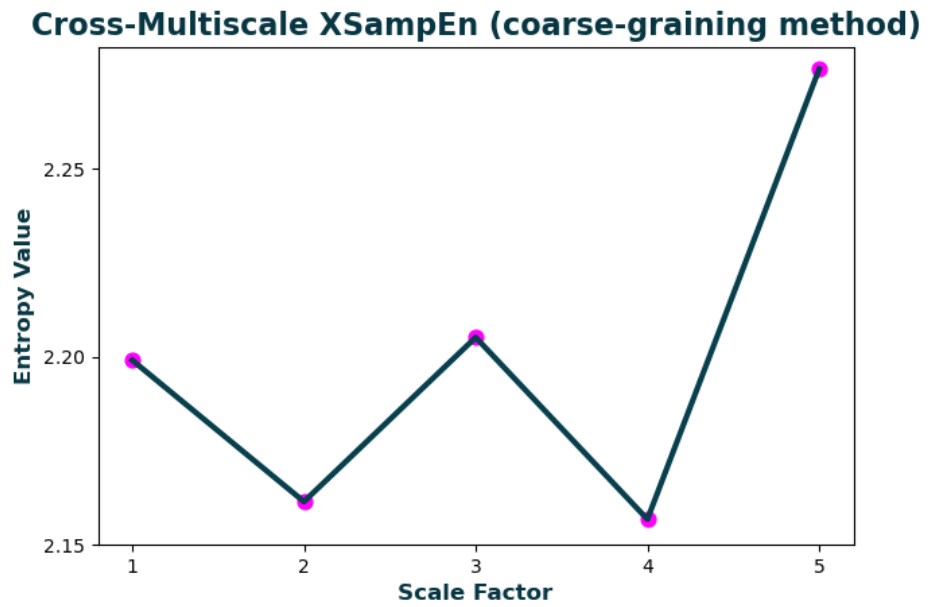

"imf" Grained time series at scale τ is the cumulative sum of intrinsic mode functions (IMF^1 to IMF^τ), where IMF^1 is the first sifting. [47]
***Note:** The empirical mode decomposition method use to derive the IMFs differs slightly between **MatLab**, **Python** and **Julia**, so **MSx** values will be inconsistent between the platforms.
****Note: Julia's** empirical mode decomposition method is unstable and may fully decompose highly stochastic or aperiodic signals.

RadNew Radius rescaling method, an integer in the range $[0 \ 4]$.
When the **Cross**-entropy method specified by **Mobj** is **XSampEn** or **XApEn**, **RadNew** allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (**r**) is specified in **Mobj**, this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of **RadNew** specifies one of the following methods:

- 0** no rescaling
- 1** Standard Deviation - $r\sigma_{X_\tau}$
- 2** Variance - $r\sigma_{X_\tau}^2$
- 3** Mean Absolute Deviation - $r(\frac{1}{N} \sum |X_\tau - \bar{X}_\tau|)$
- 4** Median Absolute Deviation - $r(\text{median}(|X_\tau - \text{median}(X_\tau)|))$

Plotx A plot of the multiscale entropy curve
true Plots time scale vs cross-entropy value.
false No plot.

An example multiscale cross-entropy curve of two normally-distributed random number sequences using cross-sample entropy over 5 coarse-grained time scales.

Outputs

MSx Multiscale cross-entropy estimate at each time scale (τ), a vector of length **Scales**.
Ci Complexity index (area under the multiscale entropy curve), a scalar.

3.4.3 cXMSEn: Composite & Refined-Composite Multiscale Cross-Entropy

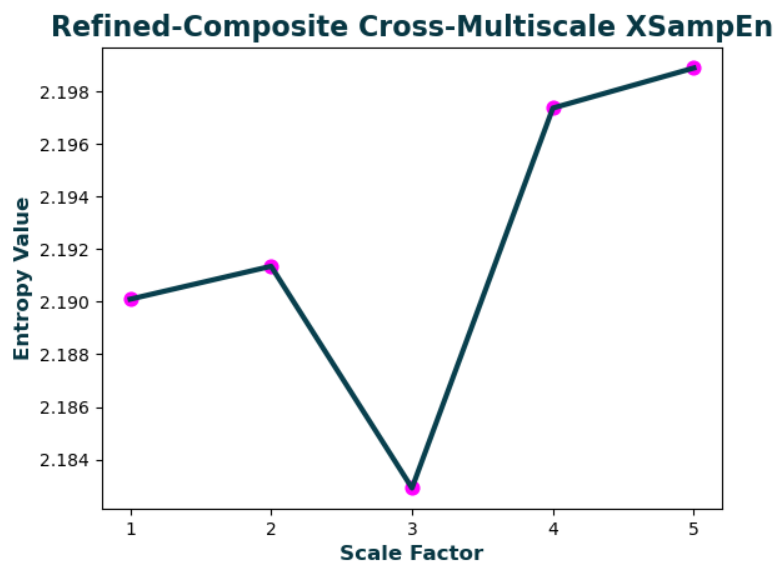

Syntax

```
[MSx, Ci] = cXMSEn(Sig, 'Scales', 3, 'RadNew', 0, 'Refined', false, 'Plotx',
false)
MSx, Ci = cXMSEn(Sig, Scales = 3, RadNew = 0, Refined = False, Plotx = False)
MSx, Ci = cXMSEn(Sig, Scales = 3, RadNew = 0, Refined = false, Plotx = false)
```

Arguments

Sig	Time series signals, a $N \times 2$ matrix where $N > 10$.
Scales	Number of time scales, a positive integer.
RadNew	Radius rescaling method, an integer in the range [0 4]. When the Cross -entropy method specified by Mobj is XSampEn or XApEn , RadNew allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (r) is specified in Mobj , this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of RadNew specifies one of the following methods:
0	no rescaling
1	Standard Deviation - $r\sigma_{X_\tau}$
2	Variance - $r\sigma_{X_\tau}^2$
3	Mean Absolute Deviation - $r(\frac{1}{N} \sum X_\tau - \bar{X}_\tau)$
4	Median Absolute Deviation - $r(\text{median}(X_\tau - \text{median}(X_\tau)))$
Refined	When Refined == true and the entropy function (EnType) contained in Mobj is XSampEn , cXMSEn returns the refined-composite multiscale cross-entropy (rcXMSEn). [54]
Plotx	A plot of the multiscale entropy curve true Plots time scale vs entropy value. false No plot. <i>Example of composite multiscale cross-entropy and refined-composite multiscale cross-entropy curves for two sets of normally-distributed random number sequences using cross-sample entropy over 5 time scales.</i>

Outputs

- MSx** Composite multiscale cross-entropy estimate at each time scale (τ), a vector of length **Scales**.
- Ci** Complexity index (area under the multiscale entropy curve), a scalar.

3.4.4 rXMSEn: Refined Multiscale Cross-Entropy

Syntax

```
[MSx, Ci] = rXMSEn(Sig, 'Scales', 3, 'F_Order', 6, 'F_Num', 0.5, 'RadNew', 0,
'Plotx', false)
MSx, Ci = rXMSEn(Sig, Scales = 3, F_Order = 6, F_Num = 0.5, RadNew = 0, Plotx
= False)
MSx, Ci = rXMSEn(Sig, Scales = 3, F_Order = 6, F_Num = 0.5, RadNew = 0, Plotx
= false)
```

Arguments

Sig	Time series signals, a N x 2 matrix where N > 10.
Scales	Number of time scales, a positive integer.
F_Order	Butterworth low-pass filter order, a positive integer > 1, (default: 6)
F_Num	Numerator of Butterworth low-pass filter cutoff frequency, where $[0 < F_{Num} < 1]$. The cutoff frequency at each scale (τ) becomes: $F_c = \frac{F_{Num}}{\tau}$ (default: 0.5)
RadNew	Radius rescaling method, an integer in the range [0 4]. When the Cross -entropy method specified by Mobj is XSampEn or XApEn , RadNew allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (r) is specified in Mobj , this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of RadNew specifies one of the following methods: 0 no rescaling 1 Standard Deviation - $r\sigma_{X_\tau}$ 2 Variance - $r\sigma_{X_\tau}^2$ 3 Mean Absolute Deviation - $r(\frac{1}{N} \sum X_\tau - \bar{X}_\tau)$ 4 Median Absolute Deviation - $r(\text{median}(X_\tau - \text{median}(X_\tau)))$
Plotx	A plot of the multiscale entropy curve true Plots time scale vs entropy value. false No plot.

Example of a refined multiscale cross-entropy curve for two normally distributed random number sequences using cross-sample entropy over 5 time scales.

Outputs

MSx	Refined multiscale cross-entropy estimate at each time scale (τ), a vector of length Scales .
Ci	Complexity index (area under the multiscale entropy curve), a scalar.

References [\[42\]](#) [\[58\]](#) [\[55\]](#)

3.4.5 hXMSEn: Hierarchical Multiscale Cross-Entropy

Syntax

```
[MSx, Ci] = hXMSEn(Sig, 'Scales', 3, 'RadNew', 0, 'Plotx', false)
MSx, Ci = hXMSEn(Sig, Scales = 3, RadNew = 0, Plotx = False)
MSx, Ci = hXMSEn(Sig, Scales = 3, RadNew = 0, Plotx = false)
```

Arguments

- Sig** Time series signals, a $N \times 2$ matrix where $N > 10$.
The length of **Sig** (K) is halved at each scale. Only use the first 2^N data points are used such that $\min(K - 2^N)$.
i.e. For signals of 5000 points, only the first 4096 points are used. For signals of 1500 points, only the first 1024 points are used.
- Scales** Number of time scales, a positive integer.
- RadNew** Radius rescaling method, an integer in the range $[0 \ 4]$.
When the **Cross**-entropy method specified by **Mobj** is **XSampEn** or **XApEn**, **RadNew** allows the radius threshold to be updated based on the grained signal at each time scale (X_τ). If a radius threshold value (**r**) is specified in **Mobj**, this becomes the rescaling coefficient, otherwise it is set to 0.2 (default). The value of **RadNew** specifies one of the following methods:
- 0** no rescaling
 - 1** Standard Deviation - $r\sigma_{X_\tau}$
 - 2** Variance - $r\sigma_{X_\tau}^2$
 - 3** Mean Absolute Deviation - $r(\frac{1}{N} \sum |X_\tau - \bar{X}_\tau|)$
 - 4** Median Absolute Deviation - $r(\text{median}(|X_\tau - \text{median}(X_\tau)|))$
- Plotx** A plot of the multiscale entropy curve
true Plots a curve of the average cross-entropy value at each time scale (i.e. the multiscale entropy curve) and a hierarchical graph showing the cross-entropy value of each node in the hierarchical tree decomposition.
false No plot.
Example of a multiscale cross-entropy curve and a hierarchical tree graph for two normally distributed random number sequences using cross-sample entropy over 4 time scales.

Outputs

MSx	Cross-entropy estimate at each node in the hierarchical tree, a vector of length $2^{Scales} - 1$.
Sn	Average cross-entropy value across each scale of hierarchical tree, a vector of length Scales .
Ci	Complexity index (area under the multiscale entropy curve), a scalar.

References [\[57\]](#)

3.5 Bidimensional Entropy Functions

While EntropyHub functions primarily apply to time series data, with the following bidimensional entropy functions one can estimate the entropy of two-dimensional (2D) matrices. Hence, bidimensional entropy functions are useful for applications such as image analysis.

IMPORTANT NOTE

Each bidimensional entropy function (**SampEn2D**, **FuzzEn2D**, **DistEn2D**) has an important keyword argument - **Lock**. Bidimensional entropy functions are "locked" by default (**Lock** == `true`) to only permit matrices with a maximum size of 128 x 128.

The reason for this is because there are hundreds of millions of pairwise calculations performed in the estimation of bidimensional entropy, so memory errors often occur when storing data on RAM.

e.g. For a matrix of size [200 x 200], an embedding dimension (**m**) = 3, and a time delay (**tau**) = 1, there are 753,049,836 pairwise matrix comparisons (6,777,448,524 elemental subtractions).

To pass matrices with sizes greater than [128 x 128], set **Lock** = `false`.

*** WARNING: unlocking the permitted matrix size may cause your programming environment to crash.***

3.5.1 SampEn2D: Bidimensional Sample Entropy

Syntax

```
[SE2D, Phi1, Phi2] = SampEn2D(Mat, 'm', floor(size(Mat)/10), 'tau', 1, 'r',
0.2*std(Mat), 'Logx', exp(1), 'Lock', true)
SE2D, Phi1, Phi2 = SampEn2D(Mat, m = Mat.shape//10, tau = 1, r = 0.2*np.std(Mat),
Logx = np.exp(1), Lock = True)
SE2D, Phi1, Phi2 = SampEn2D(Mat, m = floor(Int,size(Mat)./10), tau = 1,
r = 0.2*std(Mat), Logx = exp(1)), Lock = true)
```

Arguments

Mat	N x M matrix, where N, M > 10.
m	Embedding dimension, [default: (floor(N/10) floor(M/10))] - an integer > 1 for square submatrix embedding, or - a two-element tuple of integers > 1 representing the height and width of the template submatrix.
tau	Time delay, a positive integer.
r	Distance threshold value, a positive scalar.
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Lock	See note on matrix size locking true Matrix height (N) and width (M) must be < 128 elements. false Matrix of any size can be passed.

Outputs

SE2D	Bidimensional sample entropy estimate.
Phi1	The number of matched submatrices for embedding dimensions (m).
Phi2	The number of matched submatrices for embedding dimensions (m+1).

<u>References</u>	[62]
-------------------	----------------------

3.5.2 FuzzEn2D: Bidimensional Fuzzy Entropy

Syntax

```
Fuzz2D = FuzzEn2D(Mat, 'm', floor(size(Mat)/10), 'tau', 1, 'Fx', 'default', 'r',
[0.2, 2], 'Logx', exp(1), 'Lock', true)
Fuzz2D = FuzzEn2D(Mat, m = Mat.shape//10, tau = 1, Fx = 'default', r = (0.2,
2), Logx = np.exp(1), Lock = True)
Fuzz2D = FuzzEn2D(Mat, m = floor(Int, size(Mat)./10), tau = 1, Fx = "default",
r = (0.2, 2), Logx = exp(1), Lock = true)
```

Arguments

Mat N x M matrix, where N, M > 10.
m Embedding dimension, [default: (floor(N/10) floor(M/10))]
- an integer > 1 for square submatrix embedding, or
- a two-element tuple of integers > 1 representing the height and width of the template submatrix.
tau Time delay, a positive integer.
Fx Type of fuzzy function for distance transformation, one of the following strings:
"default" $f(x) = \exp(-\frac{x^{r_2}}{r_1})$

"sigmoid"/"modsampe"

$$f(x) = (1 + \exp(\frac{x-r_2}{r_1}))^{-1}$$

"gudermannian"

$$g(x) = \operatorname{atan}\left(\frac{\tanh(r_1)}{x}\right)$$

$$f(x) = \frac{g(x)}{g(x_{max})}$$

Note: Distances are normalized w.r.t. maximum distance relative to each state vector.

"linear"

If $r = 0$:

$$f(x) = \exp\left(-\frac{x-x_{min}}{x_{max}-x_{min}}\right)$$

If $r = 1$:

$$f(x) = \exp(-(x - x_{min}))$$

r	Parameters of the fuzzy function specified by Fx , a 1 element scalar or a 2 element tuple of positive values depending on the fuzzy function as shown above.
Default	Two element tuple (or vector in MatLab)
Sigmoid/ModSampEn	Two element tuple (or vector in MatLab)
Gudermannian	A scalar value
Linear	0 or 1
Logx	Logarithm base in Shannon's entropy formula, a positive scalar.
Lock	See note on matrix size locking
	true Matrix height (N) and width (M) must be < 128 elements.
	false Matrix of any size can be passed.

Outputs

Fuzz2D Bidimensional fuzzy entropy estimate.

References [\[63\]](#), [\[64\]](#)

3.5.3 DistEn2D: Bidimensional Distribution Entropy

Syntax

```
Dist2D = DistEn2D(Mat, 'm', floor(size(Mat)/10), 'tau', 1, 'Bins', 'sturges',
'Logx', 2, 'Norm', true, 'Lock', true)
Dist2D = DistEn2D(Mat, m = Mat.shape//10, tau = 1, Bins = 'sturges', Logx = 2,
Norm = True, Lock = True)
Dist2D = DistEn2D(Mat, m = floor(Int, size(Mat)./10), tau = 1, Bins = "Sturges",
Logx = 2, Norm = true Lock = true)
```

Arguments

Mat	N x M matrix, where N, M > 10.
m	Embedding dimension, [default: (floor(N/10) floor(M/10))] - an integer > 1 for square submatrix embedding, or - a two-element tuple of integers > 1 representing the height and width of the template submatrix.
tau	Time delay, a positive integer.
Bins	Histogram binning method, in integer > 1 indicating the number of bins, or one of the following strings: "sturges", "sqrt", "rice", "doanes" [default: "sturges"]
Logx	Logarithm base in Shannon's entropy formula, a positive scalar. (Enter 0 for natural logarithm)
Norm	Normalization of Dist2D value: false no normalisation true normalises w.r.t number of histogram bins (default)
Lock	See note on matrix size locking true Matrix height (N) and width (M) must be < 128 elements. false Matrix of any size can be passed.

Outputs

Dist2D	Bidimensional distribution entropy estimate.

Examples

The following sections provide some basic examples of EntropyHub functions. These examples are merely a snippet of the full range of EntropyHub functionality.

There is a custom documentation section installed with the toolkit in MatLab which provides several useful examples of every function in more detail than what is shown here. Thus, if you are using EntropyHub for MatLab, we recommend that you consult the custom EntropyHub documentation in MatLab for more in-depth examples.

In the following examples, signals / data are imported into MatLab/Python/Julia using the `ExampleData()` function from EntropyHub. To use this function as outlined in the examples below, **an internet connection is required**.

`ExampleData()` accepts any of the following strings:

<code>'uniform'</code>	vector of uniformly distributed random numbers in range $[0\ 1]$
<code>'gaussian'</code>	vector of normally distributed random numbers with $\mu = 0, \sigma = 1$
<code>'randintegers'</code>	vector of uniformly distributed pseudorandom integers in range $[1\ 8]$
<code>'chirp'</code>	vector of chirp signal with the following parameters: $f_0 = .01, t_1 = 4000, f_1 = .025$

<code>'lorenz'</code>	3-column matrix: X, Y, Z components of the Lorenz system ($\sigma : 10, \beta : \frac{8}{3}, \rho : 28$), [$X_o = 10, Y_o = 20, Z_o = 10$]
<code>'henon'</code>	2-column matrix: X, Y components of the Henon attractor ($\alpha : 1.4, \beta : .3$), [$X_o = 0, Y_o = 0$]
<code>'uniform2'</code>	2-column matrix: uniformly distributed random numbers in range [0 1]
<code>'gaussian2'</code>	2-column matrix: normally distributed random numbers with $\mu = 0, \sigma = 1$
<code>'randintegers2'</code>	2-column matrix: uniformly distributed pseudorandom integers in range [1 8]
<code>'uniformMat'</code>	Matrix of uniformly distributed random numbers in range [0 1]
<code>'gaussianMat'</code>	Matrix of normally distributed random numbers with $\mu = 0, \sigma = 1$
<code>'randintegersMat'</code>	Matrix of uniformly distributed pseudorandom integers in range [1 8]
<code>'mandelbrotMat'</code>	Matrix of image of fractal generated from the mandelbrot set
<code>'entropyhubMat'</code>	Matrix of image of the entropyhub logo

THINGS TO REMEMBER

For **cross-entropy** and **multiscale cross-entropy** functions, the two time series signals are passed as a two-column or two-row matrix. At present, it is not possible to pass signals of different lengths separately.

Parameters of the base or cross- entropy methods are passed to multiscale and multiscale cross- functions using the multiscale entropy object using **MSobject**. Base and cross- entropy methods are declared with **MSobject()** using a string name in **MatLab** and **Python**. In **Julia**, base and cross- entropy methods are passed as a function. See the **MSobject** example in the following sections for more info.

Each bidimensional entropy function (**SampEn2D**, **FuzzEn2D**, **DistEn2D**) has an important keyword argument - **Lock**. Bidimensional entropy functions are "locked" by default (**Lock == true**) to only permit matrices with a maximum size of 128 x 128.

In hierarchical multiscale entropy (**hMSEn**) and hierarchical multiscale cross-entropy (**hXMSEn**) functions, the length of the time series signal(s) is halved at each scale. Thus, **hMSEn** and **hXMSEn** only use the first 2^N data points where $2^N \leq$ the length of the original time series signal.

i.e. For a signal of 5000 points, only the first 4096 are used. For a signal of 1500 points, only the first 1024 are used.

4.1 MatLab:

4.1.1 Example 1: Sample Entropy

Import a signal of normally distributed random numbers [$\mu = 0, \sigma = 1$], and calculate the sample entropy for each embedding dimension (m) from 0 to 4.

```
X = ExampleData('gaussian');

Samp = SampEn(X, 'm', 4)

>>> Samp = 1×5
    2.1789    2.1757    2.1820    2.2210    2.1756
```

Select the last value to get the sample entropy for $m = 4$.

```
Samp(end)
>>> ans = 2.1756
```

Calculate the sample entropy for each embedding dimension (m) from 0 to 4 with a time delay (tau) of 2 samples.

```
Samp = SampEn(X, 'm', 4, 'tau', 2)

>>> Samp = 1×5
    2.1789    2.1833    2.1880    2.1892    2.1441
```

4.1.2 Example 2: (Fine-Grained) Permutation Entropy

Import the x, y, and z components of the Lorenz system of equations.

```
Data = ExampleData('lorenz');
figure('Color', 'k')

plot3(Data(:,1), Data(:,2), Data(:,3), 'g.')
xlabel('x-component','color','g'),
ylabel('y-component','color','g'),
zlabel('z-component','color','g'),
view(-10,10), set(gca,'color','k'), axis square
```

Calculate fine-grained permutation entropy of the z component in dits (logarithm base 10) with an embedding dimension of 3, time delay of 2, an alpha parameter of 1.234. Return Pnorm normalised w.r.t the number of all possible permutations (m!) and the condition permutation entropy (cPE) estimate.

```
Z = Data(:,3);
[Perm, Pnorm, cPE] = PermEn(Z, 'm', 3, 'tau', 2, 'Typex', ...
    'finegrain', 'tpx', 1.234, 'Logx', 10, ...
    'Norm', false)

>>> Perm = 1×3
         0         0.8687         0.9468
Pnorm = 1×3
      NaN         0.8687         0.4734
cPE = 1×2
         0.8687         0.0781
```

4.1.3 Example 3: Phase Entropy w/ Poincaré plot

Import the x and y components of the Henon system of equations.

```
Data = ExampleData('henon');
figure('Color', 'k')
plot(Data(:,1), Data(:,2), 'g.')
xlabel('x-component','color','g'),
ylabel('y-component','color','g')
set(gca,'color','k'), axis square
```

Calculate the phase entropy of the y-component in bits (logarithm base 2) without normalization using 7 angular partitions and return the second-order difference plot.

```
Y = Data(:,2);
Phas = PhasEn(Y, 'K', 7, 'Norm', false, 'Logx', 2, ...
    'Plotx', true)

>>> Phas = 2.0193
```

Calculate the phase entropy of the x-component using 11 angular partitions, a time delay of 2, and return the second-order difference plot.

```
X = Data(:,1);
Phas = PhasEn(X, 'K', 11, 'tau', 2, 'Plotx', true)

>>> Phas = 0.8395
```

4.1.4 Example 4: Cross-Distribution Entropy w/ Different Binning Methods

Import a signal of pseudorandom integers in the range [1, 8] and calculate the cross-distribution entropy with an embedding dimension of 5, a time delay (τ) of 3, and Sturges' bin selection method.

```
X = ExampleData('randintegers2');

XDist = XDistEn(X, 'm', 5, 'tau', 3)

>>> Note: 17/25 bins were empty
XDist = 0.5248
```

Use Rice's method to determine the number of histogram bins and return the probability of each bin (P_{pi}).

```
[XDist, Ppi] = XDistEn(X, 'm', 5, 'tau', 3, 'Bins', 'rice')

>>> Note: 407/415 bins were empty
      XDist = 0.2802
      Ppi = 1×8
      0.0000    0.0047    0.0368    0.1096    ...
           0.1978    0.2558    0.2421    0.1531
```

4.1.5 Example 5: Multiscale Entropy Object [MSobject()]

Create a multiscale entropy object (Mobj) for multiscale fuzzy entropy, calculated with an embedding dimension of 5, a time delay of 2, using a sigmoidal fuzzy function with the r scaling parameters (3, 1.2).

```
Mobj = MSobject('FuzzEn', 'm', 5, 'tau', 2, 'Fx', ...  
               'sigmoid', 'r', [3, 1.2])  
  
>>> Mobj = struct with fields:  
    Func: @FuzzEn  
        m: 5  
    tau: 2  
        r: [3 1.2000]  
        Fx: 'sigmoid'
```

Create a multiscale entropy object (Mobj) for multiscale corrected-cross-conditional entropy, calculated with an embedding dimension of 6 and using a 11-symbolic data transform.

```
Mobj = MSobject('XCondEn', 'm', 6, 'c', 11)  
  
>>> Mobj = struct with fields:  
    Func: @XCondEn  
        m: 6  
        c: 11
```

4.1.6 Example 6: Multiscale [Increment] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range [1,8] and create a multiscale entropy object with the following parameters:

EnType = IncrEn(), embedding dimension = 3, a quantifying resolution = 6, normalization = true.

```
X = ExampleData('randintegers');

Mobj = MSobject('IncrEn', 'm', 3, 'R', 6, 'Norm', true)
>>> Mobj = struct with fields:
    Func: @IncrEn
        m: 3
        R: 6
    Norm: 1
```

Calculate the multiscale increment entropy over 5 temporal scales using the **modified** graining procedure where,

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{i=(j-1)\tau+1}^{j\tau} x_i, \quad 1 \leq j \leq \frac{N}{\tau}$$

```
MSx = MSeN(X, Mobj, 'Scales', 5, 'Methodx', 'modified')

. . . . .
>>> MSx = 1×5
    4.2719    4.3059    4.2863    4.2494    4.2773
```

4.1.7 Example 7: Refined Multiscale [Sample] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range [1, 8] and create a multiscale entropy object with the following parameters:

EnType = SampEn(), embedding dimension = 4, radius threshold = 1.25

```
X = ExampleData('randintegers');

Mobj = MSobject('SampEn', 'm', 4, 'r', 1.25)

>>> Mobj = struct with fields:
    Func: @SampEn
        m: 4
        r: 1.2500
```

Calculate the refined multiscale sample entropy and the complexity index (Ci) over 5 temporal scales using a 3rd order Butterworth filter with a normalised corner frequency of at each temporal scale (τ), where the radius threshold value (r) specified by Mobj becomes scaled by the median absolute deviation of the filtered signal at each scale.

```
[MSx, Ci] = rMSEn(X, Mobj, 'Scales', 5, 'F_Order', 3, ...
    'F_Num', 0.6, 'RadNew', 4)

. . . . .
>>>MSx = 1×5
    0.5280    0.5734    0.5939    0.5908    0.5563
Ci = 2.8424
```

4.1.8 Example 8: Composite Multiscale Cross-[Approximate] Entropy

Import two signals of uniformly distributed pseudorandom integers in the range [1 8] and create a multiscale entropy object with the following parameters:

EnType = XApEn(), embedding dimension = 2, time delay = 2, radius distance threshold = 0.5.

```
X = ExampleData('randintegers2');

Mobj = MSobject('XApEn', 'm', 2, 'tau', 2, 'r', 0.5)

>>> Mobj = struct with fields:
    Func: @XApEn
        m: 2
    tau: 2
        r: 0.5000
```

Calculate the composite multiscale cross-approximate entropy over 3 temporal scales where the radius distance threshold value (r) specified by Mobj becomes scaled by the variance of the signal at each scale.

```
MSx = cXMSEn(X, Mobj, 'Scales', 3, 'RadNew', 1)

. . . . .
>>> MSx = 1×3
    1.0893    1.4746    1.2932
```

4.1.9 Example 9: Hierarchical Multiscale *corrected* Cross-[Conditional] Entropy

Import the x and y components of the Henon system of equations and create a multiscale entropy object with the following parameters:

EnType = XCondEn(), embedding dimension = 2, time delay = 2, number of symbols = 12, logarithm base = 2, normalization = true

```
Data = ExampleData('henon');

figure('Color', 'k')
plot(Data(:,1), Data(:,2), 'g.')
xlabel('x-component','color','g')
ylabel('y-component','color','g')
set(gca,'color','k'), axis square

Mobj = MSObject('XCondEn', 'm', 2, 'tau', 2, ...
    'c', 12, 'Logx', 2, 'Norm', true)
```

Calculate the hierarchical multiscale corrected cross-conditional entropy over 4 temporal scales and return the average cross-entropy at each scale (S_n), the complexity index (C_i), and a plot of the multiscale entropy curve and the hierarchical tree with the cross-entropy value at each node.

```
[MSx, Sn, Ci] = hXMSEn(Data, Mobj, 'Scales', 4, ...
    'Plotx', true)

>>> Only first 4096 samples were used in
    hierarchical decomposition.
>>> The last 404 samples of each data sequence were ignored.

>>> MSx = 1×15
    0.5159    0.6245    0.5634    0.7022    0.6533
    0.5853    0.7956    0.8447    0.7605    0.8415
    0.8115    0.5128    0.6862    0.8679    0.8287
Sn = 1×4
    0.5159    0.5940    0.6841    0.7692
Ci =
2.5632
```

4.1.10 Example 10: Bidimensional Fuzzy Entropy

Import an image of a Mandelbrot fractal as a matrix.

```
X = ExampleData('mandelbrot_Mat');

figure('Color','k'),
imshow(X,[],'InitialMagnification',500),
colormap('hot')
```

Calculate the bidimensional fuzzy entropy in trits (logarithm base 3) with a template matrix of size [8 x 5], and a time delay (tau) of 2 using a 'linear' fuzzy function with distances linearly normalised to the range [0, 1].

$$f(x) = \exp\left(-\frac{x-x_{\min}}{x_{\max}-x_{\min}}\right)$$

```
FE2D = FuzzEn2D(X, 'm', [8 5], 'tau', 2, 'Fx', . . .
    'linear', 'r', 0, 'Logx', 3)

>>> FE2D =
    0.0016
```

4.2.1 Example 1: Sample Entropy

Import a signal of normally distributed random numbers [$\mu = 0, \sigma = 1$], and calculate the sample entropy for each embedding dimension (m) from 0 to 4.

```
X = eh.ExampleData('gaussian');  
  
Samp, Phi1, Phi2 = eh.SampEn(X, m = 4)  
  
>>> Samp =  
      array([2.1789, 2.1757, 2.1819, 2.2209, 2.1756])
```

Select the last value to get the sample entropy for $m = 4$.

```
Samp[-1]  
  
>>> 2.1756
```

Calculate the sample entropy for each embedding dimension (m) from 0 to 4 with a time delay (tau) of 2 samples.

```
Samp, Phi1, Phi2 = eh.SampEn(X, m = 4, tau = 2)  
  
>>> Samp =  
      array([2.1789    2.1833    2.1880    2.1892    2.1441])
```

4.2.2 Example 2: (Fine-Grained) Permutation Entropy

Import the x, y, and z components of the Lorenz system of equations.

```
Data = eh.ExampleData('lorenz');

from matplotlib.pyplot import fig, scatter, axis

fig = figure(facecolor='k')
ax = fig.add_subplot(111, projection='3d')
ax.set_facecolor('k')
ax.scatter(Data[:,0], Data[:,1], Data[:,2], c='g')
ax.axis('off')
```

Calculate fine-grained permutation entropy of the z component in dits (logarithm base 10) with an embedding dimension of 3, time delay of 2, an alpha parameter of 1.234. Return Pnorm normalised w.r.t the number of all possible permutations ($m!$) and the condition permutation entropy (cPE) estimate.

```
Z = Data[:,2];

Perm, Pnorm, cPE = eh.PermEn(Z, m = 3, tau = 2,
Typex = 'finegrain', tpx = 1.234, Logx = 10, Norm = False)

>>> Perm
```

```
array([-0.   ,  0.8687,  0.9468])  
>>> Pnorm  
array([ nan,  0.8687,  0.4734])  
>>> cPE  
array([0.8687, 0.0781])
```

4.2.3 Example 3: Phase Entropy w/ Poincaré plot

Import the x and y components of the Henon system of equations.

```
from matplotlib.pyplot import figure, plot, axis

Data = eh.ExampleData('henon');
fig = figure(facecolor='k')
plot(Data[:,0], Data[:,1], 'g.')
axis('off')
```

Calculate the phase entropy of the y-component in bits (logarithm base 2) without normalization using 7 angular partitions and return the second-order difference plot.

```
Y = Data[:,1];
Phas = eh.PhaseEn(Y, K = 7, Norm = False, Logx = 2,
                  Plotx = True)

>>> Phas
2.0192821496913216
```

Calculate the phase entropy of the x-component using 11 angular partitions, a time delay of 2, and return the second-order difference plot.

```
X = Data[:,0]
Phas = eh.PhasEn(X, K = 11, tau = 2, Plotx = True)

>>> Phas
0.8395
```

4.2.4 Example 4: Cross-Distribution Entropy w/ Different Binning Methods

Import a signal of pseudorandom integers in the range [1, 8] and calculate the cross-distribution entropy with an embedding dimension of 5, a time delay (τ) of 3, and Sturges' bin selection method.

```
X = eh.ExampleData('randintegers2');

XDist, _ = eh.XDistEn(X, m = 5, tau = 3)

>>> Note: 17/25 bins were empty
      XDist =
      0.5248
```

Use Rice's method to determine the number of histogram bins and return the probability of each bin (Ppi).

```
XDist, Ppi = eh.XDistEn(X, m = 5, tau = 3, Bins = 'rice')

>>> Note: 407/415 bins were empty
>>> XDist =
      0.2802

>>> Ppi =
      array([0.0000    0.0047    0.0368    0.1096
             0.1978    0.2558    0.2421    0.1531])
```

4.2.5 Example 5: Multiscale Entropy Object [MSobject()]

Create a multiscale entropy object (Mobj) for multiscale fuzzy entropy, calculated with an embedding dimension of 5, a time delay of 2, using a sigmoidal fuzzy function with the r scaling parameters (3, 1.2).

```
Mobj = eh.MSobject('FuzzEn', m = 5, tau = 2,
                  Fx = 'sigmoid', r = (3, 1.2))

Mobj.Func
>>> <function EntropyHub._FuzzEn.FuzzEn(Sig, m=2,
    tau=1, r=(0.2, 2), Fx='default', Logx=2.71828)>

Mobj.Kwargs
>>> {'m': 5, 'tau': 2, 'Fx': 'sigmoid', 'r': (3, 1.2)}
```

Create a multiscale entropy object (Mobj) for multiscale corrected-cross-conditional entropy, calculated with an embedding dimension of 6 and using a 11-symbolic data transform.

```
Mobj = eh.MSobject('XCondEn', m = 6, c = 11)

Mobj.Func
>>> <function EntropyHub._XCondEn.XCondEn(Sig, m=2,
    tau=1, c=6, Logx=2.71828, Norm=False)>

Mobj.Kwargs
>>> {'m': 6, 'c': 11}
```

4.2.6 Example 6: Multiscale [Increment] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range [1,8] and create a multiscale entropy object with the following parameters:

EnType = IncrEn(), embedding dimension = 3, a quantifying resolution = 6, normalization = true.

```
X = eh.ExampleData('randintegers');

Mobj = eh.MSobject('IncrEn', m = 3, R = 6, Norm = True)

Mobj.Func
>>> <function EntropyHub._IncrEn.IncrEn(Sig,
      m=2, tau=1, R=4, Logx=2, Norm=False)>

Mobj.Kwargs
>>> {'m': 3, 'R': 6, 'Norm': True}
```

Calculate the multiscale increment entropy over 5 temporal scales using the **modified** graining procedure where,

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{i=(j-1)\tau+1}^{j\tau} x_i, \quad 1 \leq j \leq \frac{N}{\tau}$$

```
MSx, _ = eh.MSEn(X, Mobj, Scales = 5, Methodx = 'modified')

. . . . .
>>> MSx =
      array([4.2719   4.3059   4.2863   4.2494   4.2773])
```

4.2.7 Example 7: Refined Multiscale [Sample] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range [1, 8] and create a multiscale entropy object with the following parameters:

EnType = SampEn(), embedding dimension = 4, radius threshold = 1.25

```
X = eh.ExampleData('randintegers');

Mobj = eh.MSobject('SampEn', m = 4, r = 1.25)

Mobj.Func
>>> <function EntropyHub._SampEn.SampEn(Sig, m=2,
                                         tau=1, r=None, Logx=2.71828)>

Mobj.Kwargs
>>> {'m': 4, 'r': 1.25}
```

Calculate the refined multiscale sample entropy and the complexity index (Ci) over 5 temporal scales using a 3rd order Butterworth filter with a normalised corner frequency of at each temporal scale (τ), where the radius threshold value (r) specified by Mobj becomes scaled by the median absolute deviation of the filtered signal at each scale.

```
MSx, Ci = eh.rMSEn(X, Mobj, Scales = 5, F_Order = 3,
                   F_Num = 0.6, RadNew = 4)

. . . . .
>>> MSx
      array([0.5280, 0.5734, 0.5940, 0.5908, 0.5564])

>>> Ci
      2.842518179468045
```

4.2.8 Example 8: Composite Multiscale Cross-[Approximate] Entropy

Import two signals of uniformly distributed pseudorandom integers in the range [1 8] and create a multiscale entropy object with the following parameters:

EnType = XApEn(), embedding dimension = 2, time delay = 2, radius distance threshold = 0.5.

```
X = eh.ExampleData('randintegers2');

Mobj = eh.MSobject('XApEn', m = 2, tau = 2, r = 0.5)

Mobj.Func
>>> <function EntropyHub._XApEn.XApEn(Sig, m=2,
                                     tau=1, r=None, Logx=2.71828)>

Mobj.Kwargs
>>> {'m': 2, 'tau': 2, 'r': 0.5}
```

Calculate the composite multiscale cross-approximate entropy over 3 temporal scales where the radius distance threshold value (r) specified by Mobj becomes scaled by the variance of the signal at each scale.

```
MSx, _ = eh.cXMSEn(X, Mobj, Scales = 3, RadNew = 1)

. . . . .
>>> MSx =
array([1.089, 1.4746, 1.2932])
```

4.2.9 Example 9: Hierarchical Multiscale *corrected* Cross-[Conditional] Entropy

Import the x and y components of the Henon system of equations and create a multiscale entropy object with the following parameters:

EnType = XCondEn(), embedding dimension = 2, time delay = 2, number of symbols = 12, logarithm base = 2, normalization = true

```
from matplotlib.pyplot import figure, plot, axis

Data = eh.ExampleData('henon');

fig = figure(facecolor='k')
plot(Data[:,0], Data[:,1], 'g.')
axis('off')

Mobj = eh.MSobject('XCondEn', m = 2, tau = 2, c = 12,
                  Logx = 2, Norm = True)

Mobj.Func
>>> <function EntropyHub._XCondEn.XCondEn(Sig, m=2,
      tau=1, c=6, Logx=2.71828, Norm=False)>

Mobj.Kwargs
>>> {'m': 2, 'tau': 2, 'c': 12, 'Logx': 2, 'Norm': True}
```

Calculate the hierarchical multiscale corrected cross-conditional entropy over 4 temporal scales and return the average cross-entropy at each scale (S_n), the complexity index (C_i),

and a plot of the multiscale entropy curve and the hierarchical tree with the cross-entropy value at each node.

```
MSx, Sn, Ci = eh.hXMSEn(Data, Mobj, Scales = 4, Plotx = True)

>>> WARNING: Only first 4096 samples were used in
      hierarchical decomposition.
      The last 404 samples of each data sequence were ignored.
      . . . . .
>>> MSx =
      array([0.5159, 0.6245, 0.5634, 0.7022, 0.6533,

      2.5632
```

4.2.10 Example 10: Bidimensional Fuzzy Entropy

Import an image of a Mandelbrot fractal as a matrix.

```
X = eh.ExampleData('mandelbrot_Mat');

from matplotlib.pyplot import imshow, show

imshow(X, cmap = 'hot'), show()
```

Calculate the bidimensional fuzzy entropy in trits (logarithm base 3) with a template matrix of size [8 x 5], and a time delay (tau) of 2 using a 'linear' fuzzy function with distances linearly normalised to the range [0, 1].

$$f(x) = \exp\left(-\frac{x-x_{\min}}{x_{\max}-x_{\min}}\right)$$

```
FE2D = eh.FuzzEn2D(X, m = (8, 5), tau = 2, Fx = 'linear',
                   r = 0, Logx = 3)

>>> FE2D =
0.00159093
```

4.3 Julia:

After EntropyHub has been installed in Julia, it must be imported in order to use it.

```
using EntropyHub
```

In the following julia examples, it is assumed that EntropyHub has already been imported. To check that EntropyHub is active in your julia REPL, type:

```
julia> EntropyHub.greet()
```

```

  _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _ _

```

NOTE

Some functions have the option to return a plot of the results, e.g. `PhasEn()`, `GridEn()`, `MSEn()`, etc.

Make sure that you are using the correct plotting backend for your IDE before returning plots through EntropyHub functions.

4.3.1 Example 1: Sample Entropy

Import a signal of normally distributed random numbers [$\mu = 0, \sigma = 1$], and calculate the sample entropy for each embedding dimension (m) from 0 to 4.

```
julia> X = ExampleData("gaussian");

julia> Samp, _ = SampEn(X, m = 4)
([2.17892361, 2.17574232, 2.1819695, 2.22098397, 2.175566717])
```

Select the last value to get the sample entropy for $m = 4$.

```
julia> Samp[end]
2.178923612371957
```

Calculate the sample entropy for each embedding dimension (m) from 0 to 4 with a time delay (tau) of 2 samples.

```
julia> Samp, Phi1, Phi2 = SampEn(X, m = 4, tau = 2)
([2.17892361, 2.18332325, 2.18804107, 2.189184333, 2.1440802],
 [1.414258e6, 159224.0, 17843.0, 1998.0, 234.0],
 [1.24975e7, 1.413233e6, 159119.0, 17838.0, 1997.0])
```

4.3.2 Example 2: (Fine-Grained) Permutation Entropy

Import the x, y, and z components of the Lorenz system of equations.

```
julia> Data = ExampleData("lorenz");

julia> using Plots
julia> Plots.backend() # Check that the right backend is in use!

julia> scatter(Data[:,1], Data[:,2], Data[:,3],
markercolor = "green", markerstrokecolor = "black",
markersize = 3, background_color = "black", grid = false)
```

Calculate fine-grained permutation entropy of the z component in dits (logarithm base 10) with an embedding dimension of 3, time delay of 2, an alpha parameter of 1.234. Return Pnorm normalised w.r.t the number of all possible permutations ($m!$) and the condition permutation entropy (cPE) estimate.

```
julia> Z = Data[:,3];
julia> Perm, Pnorm, cPE = PermEn(Z, m = 3, tau = 2,
Typex = "finegrain", tpx = 1.234, Logx = 10, Norm = false)

([-0.0, 0.8686539340402203, 0.946782979031713],
[NaN, 0.8686539340402203, 0.4733914895158565],
[0.8686539340402203, 0.07812904499149276])
```

4.3.3 Example 3: Phase Entropy w/ Poincaré plot

Import the x and y components of the Henon system of equations.

```
julia> using Plots
julia> Plots.backend() # Check that the right backend is in use!
julia> Data = ExampleData("henon");

julia> scatter(Data[:,1], Data[:,2],
markercolor = "green", markerstrokecolor = "black",
markersize = 3, background_color = "black", grid = false)
```

Calculate the phase entropy of the y-component in bits (logarithm base 2) without normalization using 7 angular partitions and return the second-order difference plot.

```
julia> Y = Data[:,2];
julia> Phas = PhasEn(Y, K = 7, Norm = false, Logx = 2,
Plotx = true)
2.0193
```

Calculate the phase entropy of the x-component using 11 angular partitions, a time delay of 2, and return the second-order difference plot.

```
julia> X = Data[:,1];
julia> Phas = PhasEn(X, K = 11, tau = 2, Plotx = true)
0.8395391613164361
```

4.3.4 Example 4: Cross-Distribution Entropy w/ Different Binning Methods

Import a signal of pseudorandom integers in the range [1, 8] and calculate the cross-distribution entropy with an embedding dimension of 5, a time delay (tau) of 3, and Sturges' bin selection method.

```
julia> X = ExampleData("randintegers2");
julia> XDist, _ = XDistEn(X, m = 5, tau = 3)
Note: 17/25 bins were empty
0.524841365239631
```

Use Rice's method to determine the number of histogram bins and return the probability of each bin (Ppi).

```
julia> XDist, Ppi = XDistEn(X, m = 5, tau = 3, Bins = "rice")
Note: 407/415 bins were empty
(0.28024570808915084,
 [3.59537211e-5, 0.004693585, 0.03679902, 0.1095869, 0.1978132,
  0.25581946, 0.24212389, 0.1531279])
```

4.3.5 Example 5: Multiscale Entropy Object [MSobject()]

Note: Unlike MatLab or Python, in Julia the base and cross-entropy functions used in the multiscale entropy calculation are declared by passing EntropyHub functions to `MSobject()`, not string names.

Create a multiscale entropy object (`Mobj`) for multiscale fuzzy entropy, calculated with an embedding dimension of 5, a time delay of 2, using a sigmoidal fuzzy function with the r scaling parameters (3, 1.2).

```
julia> Mobj = MSobject(FuzzEn, m = 5, tau = 2,
                      Fx = "sigmoid", r = (3, 1.2))
(Func = EntropyHub._FuzzEn.FuzzEn, m = 5, tau = 2,
 Fx = "sigmoid", r = (3, 1.2))
```

Create a multiscale entropy object (`Mobj`) for multiscale corrected-cross-conditional entropy, calculated with an embedding dimension of 6 and using a 11-symbolic data transform.

```
julia> Mobj = MSobject(XCondEn, m = 6, c = 11)
(Func = EntropyHub._XCondEn.XCondEn, m = 6, c = 11)
```

4.3.6 Example 6: Multiscale [Increment] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range [1,8] and create a multiscale entropy object with the following parameters:

EnType = IncrEn(), **embedding dimension = 3**, **a quantifying resolution = 6**, **normalization = true**.

```
julia> X = ExampleData("randintegers");
julia> Mobj = MSubject(IncrEn, m = 3, R = 6, Norm = true);
julia> Mobj
(Func = EntropyHub._IncrEn.IncrEn, m = 3, R = 6, Norm = true)
```

Calculate the multiscale increment entropy over 5 temporal scales using the **modified** graining procedure where,

$$y_j^{(\tau)} = \frac{1}{\tau} \sum_{i=(j-1)\tau+1}^{j\tau} x_i, \quad 1 \leq j \leq \frac{N}{\tau}$$

```
julia> MSx, _ = MSeN(X, Mobj, Scales = 5, Methodx = "modified")
. . . . .
([4.2719 4.3059 4.2863 4.2494 4.2773])
```

4.3.7 Example 7: Refined Multiscale [Sample] Entropy

Import a signal of uniformly distributed pseudorandom integers in the range $[1, 8]$ and create a multiscale entropy object with the following parameters:

EnType = SampEn(), embedding dimension = 4, radius threshold = 1.25

```
julia> X = ExampleData("randintegers");
julia> Mobj = MSobject(SampEn, m = 4, r = 1.25)
(Func = EntropyHub._SampEn.SampEn, m = 4, r = 1.25)
```

Calculate the refined multiscale sample entropy and the complexity index (C_i) over 5 temporal scales using a 3rd order Butterworth filter with a normalised corner frequency of at each temporal scale (τ), where the radius threshold value (r) specified by `Mobj` becomes scaled by the median absolute deviation of the filtered signal at each scale.

```
julia> MSx, Ci = rMSEn(X, Mobj, Scales = 5, F_Order = 3,
                      F_Num = 0.6, RadNew = 4)
. . . . .
([0.52796539, 0.57338645, 0.593936, 0.5907829, 0.5564473],
2.842518179)
```

4.3.8 Example 8: Composite Multiscale Cross-[Approximate] Entropy

Import two signals of uniformly distributed pseudorandom integers in the range [1 8] and create a multiscale entropy object with the following parameters:

EnType = XApEn(), embedding dimension = 2, time delay = 2, radius distance threshold = 0.5.

```
julia> X = ExampleData("randintegers2");
julia> Mobj = MSobject(XApEn, m = 2, tau = 2, r = 0.5)
(Func = EntropyHub._XApEn.XApEn, m = 2, tau = 2, r = 0.5)
```

Calculate the composite multiscale cross-approximate entropy over 3 temporal scales where the radius distance threshold value (r) specified by Mobj becomes scaled by the variance of the signal at each scale.

```
julia> MSx, _ = cXMSEn(X, Mobj, Scales = 3, RadNew = 1)

. . . . .
[1.0893229452569062, 1.4745638145624824, 1.293182408488266]
```

4.3.9 Example 9: Hierarchical Multiscale *corrected* Cross-[Conditional] Entropy

Import the x and y components of the Henon system of equations and create a multiscale entropy object with the following parameters:

EnType = XCondEn(), embedding dimension = 2, time delay = 2, number of symbols = 12, logarithm base = 2, normalization = true

```
julia> using Plots
julia> Plots.backend() # Check that the right backend is in use!
julia> Data = ExampleData("henon");

julia> scatter(Data[:,1], Data[:,2],
markercolor = "green", markerstrokecolor = "black",
markersize = 3, background_color = "black", grid = false)

julia> Mobj = MSubject(XCondEn, m = 2, tau = 2, c = 12,
Logx = 2, Norm = true)
(Func = EntropyHub._XCondEn.XCondEn, m = 2, tau = 2, c = 12,
Logx = 2, Norm = true)
```

Calculate the hierarchical multiscale corrected cross-conditional entropy over 4 temporal scales and return the average cross-entropy at each scale (S_n), the complexity index (C_i), and a plot of the multiscale entropy curve and the hierarchical tree with the cross-entropy value at each node.

```

MSx, Sn, Ci = hXMSEn(Data, Mobj, Scales = 4, Plotx = true)
[Warning: Only first 4096 samples were used in hierarchical
|         decomposition.
|         The last 404 samples of the data sequence were ignored.
|@ EntropyHub._hXMSEn

2.5632030151318776)

```

4.3.10 Example 10: Bidimensional Fuzzy Entropy

Import an image of a Mandelbrot fractal as a matrix.

```
julia> using Plots
julia> Plots.backend() # Check that the right backend is in use!

julia> X = ExampleData("mandelbrot_Mat");
julia> heatmap(X, background_color="black")
```

Calculate the bidimensional fuzzy entropy in trits (logarithm base 3) with a template matrix of size $[8 \times 5]$, and a time delay (τ) of 2 using a 'linear' fuzzy function with distances linearly normalised to the range $[0, 1]$.

$$f(x) = \exp\left(-\frac{x-x_{\min}}{x_{\max}-x_{\min}}\right)$$

```
julia> FE2D = FuzzEn2D(X, m = (8, 5), tau = 2,
                        Fx = "linear", r = 0, Logx = 3)
0.0015909286623630356
```
